PARIAN CEMENT for INSIDE WORK.

With this Material Houses may be finished and occupied in one-fourth the usual time, as Parian Stucco may be painted or papered within forty eight hours. A finer quality produces a beautiful and hard scagliola imitation of marble — Manufactures, FRANCIS BROTHERS, & POTT, Nine Elms, London.

HYDRAULIC LIME and ROMAN

CEMENT, manufactured by LLOYD JONES & CO. Halkin Works, Holywell, Flintshire. The Halkin Hydraulic Lime is the same as used in the construction of the Liverpool Docks, Manchester, and various waterworks, collieries, and mines throughout the country, being so long celebrated for its strong cementitious and cementing powers for masonry in water. Can be supplied by rail or water to any part of the kingdom, either in lump (loose), or ground, and in barrels and bags. The Limestone can be had in full cargoes, also their Cement in barrels, which is of a very superior quality and warranted pure. Orders to be accompanied by a banker's reference. Apply at the Works; or to E. & W. AARON, Agents, 66, South John-street, Liverpool.

GUTTA-PERCHA MILL-BANDS.—The Gutta-Percha Company beg to state that the increasing demand for the Gutta Percha Strapping for Driving bands, Lathe-traps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractibility and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands if from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Boxes, Union joints, Flasks, Bottles, Bowls, Insulating Curtain-rings, Galvanic Batteries, Daguerreotype Trays, &c. &c. manufactured by the Gutta Percha Company, and sold by their Wholesale Dealers in town and country.

TERRA COTTA and Fine STONEWARE POTTERY, warranted to stand Frost.

JOHN M. BLASHFIELD, STAMFORD POTTERY, STAMFORD, LINCOLNSHIRE, has greatly improved and economised the manufacture of TERRA COTTA and Fine STONEWARE for ARCHITECTURAL PURPOSES. He is able to make it of various new colours, so as to harmonize with Marble, Portland, and other Stones, and equal in hardness to Granite.

A Medal at the International Exhibition was awarded, in Class 10, Section C, Architectural Objects, for "Perfection in manufacture and beauty of form." A Medal was also awarded for "Terra Cotta."

Moulded Bricks, String Courses, Copings, Cills, Tracery, Balusters, Capitals, Crosses, Terminals, Vases, Statues, Brackets, Consoles, Garden Edging, Guttering, six, nine, and twelve inch Paving Tiles, &c. &c.

Also Plain and Mosaic Pavements for Halls, Churches, Conservatories, &c. in all colours.

London Office, 377, Oxford-street, W.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 21 Wharf, Macclesfield street North, City road Basin, N. Orders that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor; and duly, that the "Reports of the Jurors," page 882, of the Great Exhibition, 1851, note the grant of a First-class Medal and rank the Manufactories known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION

MAGNUS'S ENAMELLED SLATE obtained the Medal of the Society of Arts; the Prize Medal at the Great Exhibition, 1851; Two First-class Medals at the Paris Exhibition; and Two Prize Medals at the International Exhibition of 1862.

Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.

Chimney-pieces, Billiard-tables, Table-tops, Baths, Wall linings, &c. a New Illustrated Catalogue of which can be had at the Public Slate Works, 39 and 40, Upper Belgrave-place, Pimlico, S.W.

PRIZE MEDAL TO MAW & CO. INTERNATIONAL EXHIBITION, 1862.

IMPERISHABLE TESSELATED PAVEMENTS, combining a highly decorative and economical substitute for ordinary floors of their peculiar coverings. MAW & CO.'S Pattern-book, designed by M. Digby Wyatt, esq. together with a special design and estimate of cost adapted to any given dimensions of hall, passage, conservatory, verandah, frieze, &c. will be sent on application to Benthall Works, Broseley, Salop.

May be seen at the Exhibition of Building Inventions, &c. now open at the Galleries of the Architectural Exhibition, 9, Conduit-street, free.

London Agents—W. B. SIMPSON & SONS, 456, West Strand, who have on view a great variety of Specimens of the Pavements.

WILLIAM MULLER, Artists' Colourman, 62, High Holborn, London.

Drawing Paper, Tracing Paper, Colours in Oil or Water, Drawing Instruments.

Lay Figures for Sale or Hire.

READE & HEWITT'S PATENT PNEUMATIC PAN and SELF ACTING WATER CLOSETS, RAILWAY URINAL, and SEWER FLUSHING APPARATUS.

The simplest, strongest, and cheapest Closets that are self-acting efficiently with or without Supply Cistern, and at high or low pressure. Specially adapted for railway stations, offices, public buildings, workshops, and any situations where subjected to severe usage. Prevents waste of water, saves piping, cranks, wires, service box, and all the complicated apparatus of self-acting closets.

The Self-acting Pneumatic Flushing Vessel flushes ranges of urinals regularly at intervals, the time between the discharge being regulated by a simple tap, thus saving an immense quantity of water, which ordinarily runs to waste.

Best Pan Closet, complete	£2 12 6
Best Self-acting Closet, complete	2 15 0

MESSRS. JAMES B. TERSON & SON, at the CONTRACTOR'S YARD and PREMISES, situate Sand's-end, King's-road, Fulham, London. The Valuable Plant, Materials, &c. comprise the superior manufactured plant, viz. one powerful 24-inch cut-line Screw Pile driving engine, by Murray, London; one 12-inch centrifugal and one horizontal pump, and powerful double-purchase crab, by Fowler & Co.; eleven strong wellbuilt carts, with iron arms and patent boxes; eleven dobbin carts, strong and well built spring wagg n timber carriage, iron and wood skips, sixty-four Lakes of low Memel timber, varying in length from 21 feet to 40 feet; 270 new yellow deals, 19 feet long; 651 deals (various), 2,154 battens, fir planks (various), 1½ inch fir boards, short ends of deals and battens, die squares, centres, scaffold boards; also the materials of a brick building, with iron board and felt top, as now erected in said yard, as above described, and used as a smith's shop, stabling, store-house, granary, sheds, &c.; the same to be taken down and cleared away, from off the said yard and premises by and at the expense and risk of the purchaser, with in three clear days from Monday after the day of sale, as above announced. Four large fir trestles, four fir legs, under barrows, quantity of sundry bricks and tiles, fir shoots, fire wood, and other useful and miscellaneous property.—May be viewed on Monday preceding the day of Sale, from Ten till Four o'clock. Sale to commence at ELEVEN o'clock precisely. The above Plant, Materials, &c. will be fully particularized in Catalogues, which may be had (free of charge) on the Premises, and of the Auctioneers, Dover, Kent.

HEREFORD-STREET, OXFORD-STREET.—Valuable Building Materials; several tons of Lead and Ironwork.

MR. GEO. HAINES will SELL by AUCTION, on the PREMISES, on THURSDAY, OCTOBER 27, at TWELVE o'clock, the capital MATERIALS of a spacious Residence, No. 19, Hereford street, with stabling, coach house, and Three Houses adjoining, in Park-street; comprising a mass of excellent sound brickwork, prime slates, and stout timbers in the large roofs; battened and other doors, and fire grates, panelled doors, plain sashes, and wainscoting to the numerous spacious rooms; statuary marble chimney-pieces; water-closets; noble Portland stone staircases, inverted pipes, and other sundries; the stabling and small houses are useful items.—May be viewed. Catalogues of Messrs. HAINES & SON, Moorgate-street, and at the Auctioneer's Office, 29, Gravenor street West, Eaton-square, and No. 12, High-street, Kensington.

CAMDEN TOWN, near the Old Eagle Tavern and Railway Station.

MESSRS. LEREW will SELL by AUCTION, on the PREMISES, Camden-terrace, on MONDAY, OCTOBER 31, at ELEVEN for TWELVE, Eighteen Loads of White FIR BALK, 1,000 planks, deals, and battens; 2,000 feet of mahogany, 1,500 feet pencil cedar, 5,000 feet of wainscot, 3,000 feet wide pine 1½ squares of flooring, mouldings, doors, cut stuff, scaffold poles, cistern, chimney pieces, paving, and quantity of useful old materials.—Auction Offices, Cardigan street, Hampstead-road, near the Euston Station.

WOODHATCH LODGE AND HARPER'S FARM, REIGATE, SURREY.

MESSRS. NORTON, HOGGART, & TRIST have received instructions from the executors of the late Mrs. Charrington to offer for SALE, at the GOLDSMID COFFEE-HOUSE, on FRIDAY, NOVEMBER 11th, at ONE o'clock precisely (unless previously disposed of by Private Contract), WOODHATCH LODGE and HARPER'S FARM, near the town of Reigate, in the County of Surrey. This exceedingly beautiful property, the whole of which is Freehold, extends over about 128 acres of arable, pasture, and meadow land, interspersed by extensive woods and plantations, and forms in its entirety one of the most charming residences with in the same distance of London. The residence, which is approached by a lodge entrance from the Holmethill, is most beautifully placed upon the summit of the Estate, in the midst of pleasure grounds, lawns, and flower gardens, and commands an uninterrupted view of the most extensive and delightful scenery that can well be imagined. It fronts the south, making it as agreeable for occupation in the winter as in the summer season. The house immediately connected with it is replete with every convenience, and may be let or occupied by a purchaser as he may desire, and there are farm buildings and farm cottages sufficient for a bailiff's or tenant's occupation. It may be well to observe that a considerable portion of the land is very valuable for building purposes, and might be so appropriated as not to interfere with the comfort and enjoyment of the residence and a smaller quantity of land should a purchaser be disposed to purchase the whole and subdivide the remainder as he may think proper.—May be viewed by cards only, to be had with Particulars and Plans of Messrs. NORTON, HOGGART, & TRIST, 62, Old Broad-street, Royal Exchange, E.C.

CLAPTON PARK ESTATE, Lower Clapton, Middlesex.—Eligible FREEHOLD BUILDING LAND, London and Dublin Freehold.

MR. J. TAYLOR is instructed to SELL by AUCTION, at GARRAWAY'S Coffee-house, Change-alley, Cornhill, on MONDAY, NOVEMBER 7th, at TWELVE for ONE o'clock, 80 Lots of FREEHOLD BUILDING LAND, in Clapton-road, near to St. John's Church, Hackney, suitable for the erection of Cottages. Nine-tenths of the purchase money may remain on mortgage or contract at 5 per cent. interest, to be paid in nine years by equal quarterly instalments, but the whole or any part of the balance may be paid off at any time without notice. Particulars and conditions of sale may be obtained ten days before the Sale of T. W. ROGERS, Esq. Solicitor, No. 70, Fenchurch-street; at the "Pheasants Inn," Clapton; of Messrs. HAMMACK & LAMBERT, No. 59, Bishopsgate-street Within; at the Place of Sale; and of the Auctioneer, No. 70, Fenchurch street, City.

IMPORTANT.—7,780 pieces of really good modern English and French Paper hangings in great variety, removed from the premises of a noted West end firm for convenience of sale; to be sold without the slightest reserve.

MR. EDWIN WHITE will SELL, at 12, HOLBORN BARS, and 1, CASTLE STREET, Holborn-hill, on TUESDAY next, at ONE, 7,780 Pieces of PAPERHANGINGS, in flock Gilt Room lining, Stone, Marble and Oaks, Marble Cooks, and 120 Marble and Enamelled Slate Chimney-pieces, suitable for first class property. The whole of the goods (not patterns) may be viewed, and catalogues had on MONDAY, and Morning of Sale.

DUPPA'S HILL, CROYDON.—Important Sale of valuable Freehold Land, at Duppa's-hill, offering attractive Building Sites.

MESSRS. CRISPE & DRACOTT, and CHARLES SMITH & SONS (who are jointly concerned on their owners), will SELL by AUCTION, at the ROYAL HOTEL, Croydon, on THURSDAY, OCTOBER 27th, 1864, at THREE for FOUR o'clock, FIVE eligible Plots of FREEHOLD BUILDING LAND, delightfully situate upon a healthful elevation near the flourishing market town of Croydon, within two minutes of the Weldon Station, on the Surrey Side, and about half a mile from the Croydon Station on the Brighton and West London and the Addiscombe Railways, and about twenty minutes from London. These valuable building sites are to be sold in small lots, and are well adapted for the erection of villa residences have good drainage, and the roads are to be made and made over to Duppa's-hill, which has been approved by the Board of Health to the purpose of a public park. The soil is gravel and clay, the air is most salubrious, water and gas are laid on, thorough sewerage will be very shortly completed, and the charming walks and drives in the neighbourhood render this particularly desirable, where from the increasing importance of Croydon, and to extend demand for land, it offers an unusual favourable opportunity for the profitable employment of capital.—Particulars, with plans and conditions, may be had shortly at the usual in the neighbourhood; at the Place of Sale; of C. FRANKISH, Esq. Solicitor, 23 Parliament-street, Westminster; and of the Auctioneers, CHARLES SMITH & SONS, 3, Broad-st. buildings, London, E.C. and Messrs. CRISPE & DRACOTT, 145, High street, Croydon.

BUCKHURST HILL, Woodford, Essex.—Eligible Freehold Building Land

MR. WHITTINGHAM is instructed to SELL by AUCTION, at GARRAWAY'S COFFEE HOUSE, Change-alley, Cornhill, on MONDAY, OCTOBER 31st, at TWELVE for ONE, in 8 lots, the Second Portion of that most eligible FREEHOLD PROPERTY, situate between the Roebuck and Bull-head Inns, immediately opposite the church, having frontages to the new road called Rose-lane, and to the high road to Loughton of Nine inches of the purchase money may remain on mortgage or contract at five per cent to be paid in nine years, by half-yearly instalments; but the whole or any part of the balance may be paid off at any time without notice.—Particulars, plans, and conditions of sale may be obtained ten days before the sale of Mr. F. HOLWELL, Queen's road, Buckhurst-hill; of Messrs. RUSSELL & DAVIES, 59, Coleman-street, E.C.; of the Auctioneer, 14, Moorgate street, London, E.C.; and at the Place of Sale.

CLAPTON CRICKET FIELDS, LOWER CLAPTON, MIDDLESEX. Eligible Freehold Building Land

MR. WHITTINGHAM has to announce that the 1018 remaining UNSOLD of the Auction Sale on 17th instant and most of the 21 and 24, 1863, may be PURCHASED by PRIVATE CONTRACT. The purchase money is to be paid by a deposit of Ten per cent and the balance in nine years, by equal half-yearly instalments, with Five per cent. interest and the option of paying off the whole or any time without notice. For particulars and plans, apply to the Auctioneer, 14, Moorgate-street, London, E.C.

SUNNINGDALE, BERKS.—A very valuable Freehold Estate, comprising about 185 acres of Building Land, arranged in convenient plots for the erection of first-class villa residences.

MESSRS. DRIVER & CO. have received instructions to SELL by AUCTION, at the GUILDHALL COFFEE HOUSE, Cornhill, on MONDAY, OCTOBER 31, at TWELVE precisely, in 24 Lots some very valuable and desirable FREEHOLD BUILDING LAND fronting, together, about 18 acres, situate at Sunningdale, about 3 of a mile from the Railway Station, within a few minutes' walk of the Sunningdale Railway Station (which adjoins the estate), and is well known to be one of the most healthful localities in England, being fully inclosed, and embellished with ornamental plantations, commanding from every point various and extensive views of the surrounding scenery, so justly celebrated for its picturesque and truly charming beauty; the proximity to Virginia-water, Windsor Great Park and Forest, Swinley Forest, and Ascot Racecourse; and the great facility of weekand return tickets, at the low fares now in force, offer peculiar advantages for building purposes. It is intended to form a new road through the property commencing at the side of the Lock Hospital, near Work-house, to be entered upon Lot 1, for the Church, Cemetery, and which property immediately adjoins the Sunningdale and Ascot Villa Companies. Printed particulars, with plans, may be obtained of Messrs. EVERITT & LLOYD, 18, Tokenhouse-yard, E.C.; of Messrs. JANSON, COBB, & PEARSON, Solicitors, No. 4, Bedford street, E.C.; at the Estate Exchange, Change-alley, Cornhill, E.C.; at the Guildhall Coffee-house, Gresham-street, E.C.; and of Messrs. DRIVER & CO. Surveyors Land Agents, and Auctioneers, 4, Whitehall, London, S.W.

LLOYD'S MARBLE WHARF, PIMLICO.—To Sculptors, Masons, and Others

A SALE of MARBLE by AUCTION will take place at the above Wharf, by order of Messrs. Lloyd, on TUESDAY, NOVEMBER 1st, at ELEVEN for TWELVE, consisting of a large assortment of Marble, in Blocks and Slabs, viz. vein statuary, Sicilian, emperor's red, dove, black and gilt, Devil's, and other marbles; also about 10,000 feet of slab, in nearly all the above varieties. NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 73—74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves, Cooking Utensils, &c. to meet the great public demand; and also for the consequent more extensive execution of all descriptions of hot water, bath, laundry, and steam work.
73—74, Bishopsgate-street Within.

ROYAL POLYTECHNIC.—PAGANINI'S GHOST.—Engagement of this novel, extraordinary, and artistic sensation, which was received with such an enthusiastic furore upon the first night of its production at this Institution. Paganini's Ghost will perform daily at 5 and 8·45 all those difficult variations on one string and with one hand for which the late Paganini was so celebrated. Polytechnic redecorated and re-opened. Admission to the whole, 1s.

CONTRACTS.

WAR DEPARTMENT CONTRACTS.—NOTICE to BUILDERS.

TENDERS are required for the SUPPLY of MATERIALS and LABOUR for War Department WORKS, at Aldershott Camp and Permanent Barracks, in the county of Hants including Repairs to the existing buildings, under a Triennial Contract, from the 1st January, 1865, to the 31st March, 1868, determinable at any period after one year, on either party giving to the other three months' notice in writing.

Copies of the schedules, for which the sum of six shillings and nine pence for each copy must be paid on issue, together with forms of Tender, may be obtained on application at this Office.

Although the said schedules include prices for work done, and for day labour, the Contractor will, as a general rule, be called upon only to supply materials.

The Tenders to be addressed, under cover, to the Director of Contracts, War Office, Pall Mall, London, S.W. endorsed, in the left-hand corner, "Tenders for Works at Aldershott," on or before SATURDAY the 5th NOVEMBER, 1864.

The Secretary of State for War does not bind himself to accept the lowest or any of the Tenders.

Royal Engineer Office, Aldershott,
14th September, 1864.

WAR DEPARTMENT CONTRACT.—NOTICE to BUILDERS.

TENDERS are required for the ERECTION of ONE RANGE of MARRIED SOLDIERS' QUARTERS, at the Hut Encampment, Pembroke Dock.

Parties desiring to Tender for the erection of these Works must leave their names at this Office, on or before the 4th day of NOVEMBER, 1864, and pay the sum of 10s. 6d. for the bills of quantities, which will be forwarded to each party as soon as prepared by the Government Surveyor.

The Secretary of State does not bind himself to accept the lowest or any Tender.

Royal Engineer Office, Pembroke Dock, South Wales,
19th October, 1864.

WAR DEPARTMENT CONTRACT.—TO BUILDERS.

TENDERS are required for the WORKS proposed to be performed in the CONSTRUCTION of a Small BATTERY and DEFENSIBLE BARRACKS at Brean Down, Weston-super-Mare, in the County of Somerset

Forms of Tender and other information may be obtained on application to the Senior Clerk, Fortification Office, No. 109, Victoria-street, Westminster, on or before the 5th NOVEMBER, 1864. Copies of the plans may be inspected at the Office of the Barrack Master, Hordle Barracks, Bristol.

A deposit of 10s. will be required upon issuing the form of Tender, and it will be returned when the Tender is received

The Secretary of State does not bind himself to accept the lowest or any Tender.

War Office, Pall Mall, October 21, 1864.

STOCKTON and MIDDLESBROUGH WATER WORKS.—To CONTRACTORS for PIPE LAYING.—The Directors of the Stockton and Middlesbrough Water-Works Company are prepared to receive TENDERS for LAYING DOWN about Twenty Miles in length of CAST IRON SOCKET PIPES (varying in diameter from 20 inches to 12 inches) and other Pipe Castings. Specifications may be seen, and printed forms of Tender may be had on application to me, or to Mr. HAWKSLEY, C.E. 30 Great George-street, Westminster, S.W. on and after MONDAY, the 17th day of OCTOBER instant, and sealed Tenders endorsed "Tender for Pipe-laying" must be delivered at the Office of the Company, Central-buildings, Darlington, on or before TUESDAY, the 1st day of NOVEMBER next. The Directors do not bind themselves to accept the lowest or any Tender. By order,

THOMAS HALL, Secretary

Secretary's Office, Central Buildings,
Darlington, 15th October, 1864.

TO BUILDERS.—Persons desirous of TENDERING for the ERECTION of New BANKING PREMISES, for Messrs. Sparrow & Co. at Rochford, Essex, can inspect the plans and specifications, at my Offices, Chelmsford, after the 1st of NOVEMBER.—Tenders to be delivered to Messrs. SPARROW & CO. Chelmsford, by or before TWELVE o'clock on the morning of the 11th of NOVEMBER. The lowest or any Tender will not necessarily be accepted FERD. CHANCELLOR, Architect.

Pilmers' Hall, Old Broad street, London, and Chelmsford.

WEST HAM LOCAL BOARD of HEALTH.—Notice is hereby given, that the Board of Health for the District of West Ham in the county of Essex, are prepared to receive TENDERS for WIDENING the APPROACHES to the Bridge at Angel-lane, Stratford, over the Great Eastern Railway Conditions of contract, forms of Tender, and any other information, may be obtained at the Office of the Local Surveyor, at Rokeby House, Stratford, E. Tenders are to be delivered at my Office, at Rokeby House, in Stratford, not later than MONDAY, the 7th NOVEMBER next, and each of them must contain a ten-pound Bank of England note, endorsed by the party tendering, to be returned in the event either of the Tenders not being accepted, or on the completion of the contract and bond.—By order of the Board,

CHARLES WILSON, Clerk.

Rokeby House, Stratford, E. October 21, 1864.

TO BUILDERS.—Persons desirous to CONTRACT for the ERECTION of a Pair of Semi-detached HOUSES at Forest Hill, Surrey, may inspect the plans and specification at the Offices of Mr. C. DRIVER, Architect, 7, Parliament-street, S.W. and obtain a copy of the quantities upon depositing 10s. to be returned if a Tender is sent in. Tenders to be delivered not later than FRIDAY, NOVEMBER 4.

TO BUILDERS.—NEATH NEW CHURCH.—Builders are hereby invited to submit TENDERS for the ERECTION of a NEW CHURCH at Neath. The plans and specifications can be seen on and after MONDAY, the 31st instant, at the Offices of H. OWEN, Esq. in Water-street, Neath.—Estimates to be forwarded on or before the 14th of NOVEMBER next, to the Architect, JOHN NORTON Esq. 14, Old Bond street, London, W

CONTRACTS.

TO BUILDERS. — Persons desirous of TENDERING for the ERECTION of a WAREHOUSE, 80 feet by 70 feet, and 45 feet high, at Winchester, may inspect the plans and specification at my Office after the 2nd of NOVEMBER. Tenders, endorsed "Tender for Warehouse," and addressed to me, to be delivered in on or before the 18th of NOVEMBER. No pledge is given to accept the lowest or any Tender.

THOS. STOPHER, Architect.

St. Swithin-street, Winchester

CROYDON WATER WORKS.—To ENGINEERS.—CONTRACT No. 1.—Notice is hereby given, that the Croydon Local Board of Health are prepared to receive TENDERS from persons desirous of CONTRACTING with them for the CONSTRUCTION and setting to work of a Single-acting CORNISH PUMPING ENGINE, in accordance with a specification prepared by Mr. BALDWIN LATHAM, C.E. their Engineer. Such specification may be seen in the said Engineer's Office, in the Town-hall, Croydon, on or after TUESDAY, the 1st day of NOVEMBER next, sealed Tenders, indorsed "Tender for New Steam Engine," are to be delivered at the Office of the Local Board, in the Town hall, Croydon, on or before FOUR o'clock on the afternoon of TUESDAY, the 15th of NOVEMBER. The Local Board do not bind themselves to accept the lowest or any Tender.

HENRY RICHARDS, Clerk to the Board.

Trinity House, London, E.C. 20th October, 1864.

TO ENGINEERS and OTHERS.—This Corporation being desirous of obtaining TENDERS for the ERECTION of a WROUGHT-IRON PILE LIGHTHOUSE on the Reef, known as Lowestoft Scares, near the Port of Lowestoft, hereby give Notice that the plans, specifications, forms of Tender, and conditions of contract are deposited at the House, and may be inspected on any day between the hours of TEN o'clock in the forenoon and FOUR p.m.

Tenders must be delivered at the House on or before MONDAY, the 21st of NOVEMBER next, addressed to the Secretary, and marked "Tender for Iron Lighthouse," and no Tender will be entertained that it is not made on the forms provided.

The Corporation do not pledge themselves to accept the lowest or any Tender. By order of the Corporation,

F. H. BERTHON, Secretary.

PARISH of BRIGHTON.—To BUILDERS and OTHERS.—The Directors and Guardians of the Parish of Brighton are desirous of receiving TENDERS from persons willing to Contract for the ERECTION of a WORKHOUSE, upon land situate between the Reservoir and the Race Stand, in the said parish, from the plans, drawings and specification prepared for that purpose. The drawings, specification, and conditions of contract may be inspected at the Directors and Guardians' Clerk's Office, Church-street, Brighton, on any day (Sundays excepted) between the hours of TEN a.m. and FOUR p.m. Copies of the bills of quantities and forms of Tender may be obtained on and after the 1st day of NOVEMBER next, at the above-named Office, and also of Messrs. LANGDOWN, J. Ware, 4, street, Charing-cross, London, on payment of the sum of Two Guineas, which will be returned to all persons who shall Tender for the execution of the work. Tenders, indorsed "Tender for the Erection of Workhouse," to be delivered at the Office of the Clerk to the Directors and Guardians, Church-street, Brighton, on or before TUESDAY, the 15th day of NOVEMBER next, by TWO o'clock in the afternoon. Each Tender to be accompanied by a separate sealed note containing (for the approval of the Directors and Guardians) the signatures and addresses of two persons who are willing to enter into the required bonds for the due performance of the work. The Directors and Guardians will not bind themselves to accept the lowest or any Tender, neither will they be at nor allow any expense for preparing any Estimate or Tender. By order of the Board, ALFRED MORRIS, Clerk.

Parochial Offices, Brighton, 24th October, 1864.

This stone (which is a perfect oolite) is raised in blocks of any portable size, and is about 4 feet thick in the bed. It will stand ANY WEATHER, is much used for water works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.

*** The above WEATHER STONE is used largely by London Builders.

W. & J. FREEMAN, Merchants in the various descriptions of STONE, GRANITE, and SLATE, for Engineering and Building Purposes. Supplies direct from the Quarries, by vessel or railway. Direct communication with the principal ports for EXPORTATION. Wharf prices and estimates for special contracts, including quarry work or other labour, forwarded on application.—Office, 27, Millbank-street, London, S.W.

THE SCOTTISH GRANITE COMPANY (Limited) are prepared to EXECUTE ORDERS in Polished, Red, or Grey GRANITE, for Monumental or Architectural purposes. The Red Granite from their quarries is more brilliant in colour than any other known, and can be obtained in large masses. The Company are also ready to undertake Contracts for the Supply of any quantity of their material, either in blocks or ready dressed, and in lengths extending to 20 feet and upwards if required.—Specimens of the stone may be seen at the Offices of the Company, 36, Cannon-street, London, E.C. and terms may be ascertained by application to the Secretary.

ABERDEEN POLISHED GRANITE WORKS.—Awarded Prize Medal in 1851, Silver Medal in 1858, and Two Prize Medals in 1862. Red, Blue, and Grey Granite for every description of architectural construction, decoration, memorials, and general purposes. Apply to ALEX. MACDONALD, FIELD, & CO. Aberdeen; and at London Depôt, 404, Euston road, N.W. -DAVID WILLET, Agent.

POLISHED GRANITES.—TOMBS, COLUMNS, PILASTERS, &c. &c. in RED, BLUE, or GREY GRANITE, supplied by WILLIAM & JOHN FREEMAN, 27, MILLBANK STREET, LONDON, S.W.

SAMPLES of BRICKS, TILES, &c. Made at EAST COWES PARK, Can be seen in the Constructional Department, KENSINGTON MUSEUM R. LANGLEY, Agent

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr. ROBERT WHITE, and which may be seen in operation at the Brickfields of J. B. WHITE & BROTHERS, Erith, Kent. The advantages of this plan are two-fold. 1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving. 2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks. Licenses for use of the Patent granted to Brickmakers, on application to the Patentees 17, Millbank-street, Westminster.

For Designs and Estimates apply to RANDAL STAP & CO. Contractors, No. 32, KING WILLIAM STREET, E.C. Where numerous Drawings and Photographs may be seen. N.B. The Iron Building manufactured by R. STAP & CO are not fixtures on Leasehold Property.

VENTILATION.—OVERCROWDING.—Boyle's System of Natural Ventilation ensures even a more healthy condition of atmosphere in overcrowded places than is usually present in thinly-inhabited or empty places. The heat arising from the state of overcrowding is the motive power which works this system with infallible regularity and effect. The smaller, closer, hotter, and more overcrowded a place is, the easier and better can it be ventilated on this system. It is applicable to all places alike, Cottages, Mansions, Public Halls and Buildings, Churches, Hospitals, Factories, Work-rooms, Stables, Cow-houses, Conservatories, and even Mines and Ships. Let no one form a hasty conclusion from the seeming extravagance of this statement. It is a far wiser plan to examine first and conclude afterwards. "*In one instance under our own eye Mr. Boyle has operated very successfully.*"—Article, "Air in the Corners," *Builder*, 15th October, 1864. THOS. BOYLE, 23, Little St. Andrew-street, Upper St. Martin's-lane, London. Agents, Messrs. COMYN, CHING, & CO., at same address.

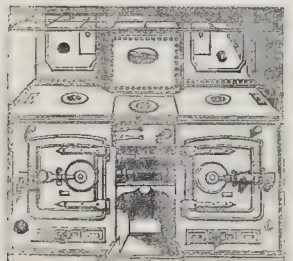
THE IMPROVED SYSTEM OF STABLE AND HARNESS FITTINGS,
PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS, AS WELL AS BY THE PRINCIPAL NOBILITY, GENTRY, AND HUNTING ESTABLISHMENTS IN THE KINGDOM.

SECURITY FROM ACCIDENT by the use of the Patent Halter Guide and Improved Curved Top-plate; PROMOTION of HEALTH, COMFORT, and CONDITION, by the cleanliness and power of resisting infection of the Mangers and Troughs; and also of the Patent Drop Cover, to curtail the quantity of water to be imbibed. ECONOMY in the USE of FOOD, from the improved formation of the Fittings, and by means of the Patent Portable Seed-box, are some of the peculiar recommendations of Cottam's Patent Componised, Enamelled, and Galvanized Iron Fittings for Stalls and Loose Boxes.

COTTAM'S PATENT COMBINED SADDLE and HARNESS BRACKETS; IMPROVED SURFACE GUTTER, WITH MOVEABLE SAFETY COVERS; Sanitary Traps, Cheap and Durable Corn-bins, and every Article requisite for the Stable and Harness-room.



IRON GATES, FENCING, and HURDLES MADE by MACHINERY.

COTTAM'S newly-invented REGISTERED NOISELESS MANGER SHACKLE and GUIDE FOR HALTER-STRAP, and IMPROVED VENTILATING HARNESS BRACKETS, are only to be obtained from the Inventors, and can be seen in use at their Manufactory.

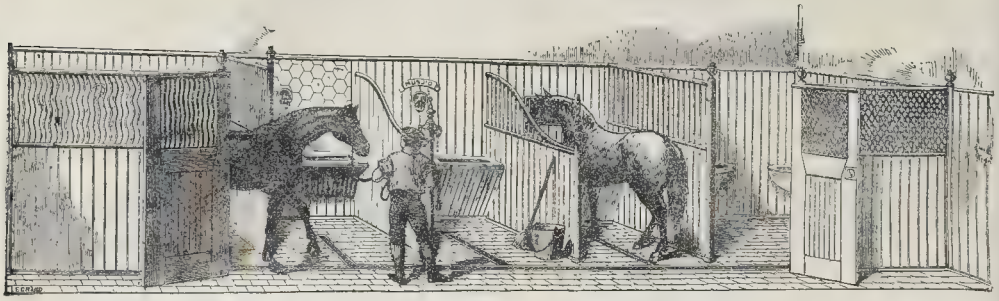
COTTAM & CO. exhibit for inspection, at their Iron Works, 2, Winsley-street, W., an extensive range of full-sized Stalls, Loose Boxes, and Harness Rooms, the most complete that can be imagined.

ILLUSTRATED CATALOGUES and LITHOGRAPHS free, on application to COTTAM and CO. 2, WINSLEY STREET, Oxford-street, London, W.

COTTAM & CO.'S only address in London, is 2, WINSLEY STREET, W.
N.B. WINSLEY STREET IS THE STREET OPPOSITE THE PANTHEON.

FENDERS, STOVES, FIRE-IRONS, AND CHIMNEY-PIECES.
Buyers of the above are requested, before finally deciding, to visit
WILLIAM S. BURTON'S SHOW-ROOMS.
They contain such an assortment of FENDERS, STOVES, RANGES, CHIMNEY-PIECES, FIRE-IRONS, and General IRONMONGERY, as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with ormolu ornaments, 3*l.* 15*s.* to 38*l.* 10*s.*; Bronzed Fenders, with standards, 7*s.* to 5*l.* 12*s.*; steel Fenders, 3*l.* 3*s.* to 11*l.*; ditto, with rich ormolu ornaments, from 3*l.* 3*s.* to 18*l.*; Chimney-pieces, from 1*l.* 8*s.* to 100*l.*; Fire-irons, from 2*s.* 3*d.* the set to 4*l.* 4*s.* The Burton and all other Patent Stoves with radiating hearth-plates.
WILLIAM S. BURTON, GENERAL FURNISHING IRONMONGER,
BY APPOINTMENT TO H.R.H. THE PRINCE OF WALES,
Sends a Catalogue, gratis, and post-paid. It contains upwards of 500 illustrations of his illimited stock of sterling Silver and Electro-Plate, Nickel Silver, and Britannia Metal Goods, dish-covers, hot-water dishes, stoves, fenders, marble chimney-pieces, kitchen ranges, lamps, gaseliers, tea trays, urns, and kettles, clocks, table cutlery, baths, toilet ware, turnery, iron and brass bedsteads, bedding, bedroom cabinet furniture, &c. with Lists of Prices and Plans of the Twenty large Show-rooms, at
39, OXFORD-STREET, W.; 1, 1A, 2, 3, and 4, NEWMAN-STREET; 4, 5, and 6, PERRY'S-PLACE, and 1, NEWMAN-YARD, LONDON.

ST. PANCRAS IRON WORK COMPANY,



OLD SAINT PANCRAS ROAD, LONDON, N.W.

APPROVAL OF THE ROYAL VETERINARY COLLEGE.

THE MEDALS OF ENGLAND AND FRANCE,

And the Medals and High Recommendation of the Royal Agricultural Societies of England and Ireland.

SECURED BY EIGHT SEPARATE PATENTS. LATEST, 1863.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, with RACK & WATER-TROUGH,

The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

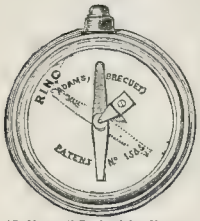
THE HALTER BALL, ATTACHED BY A NEW IMPROVEMENT, WORKS NOISELESSLY, AND ALMOST WITHOUT FRICTION.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible,—advantages peculiarly their own.

THE PATENT HARNESS FITTINGS

Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.



EVERY DESCRIPTION OF STABLE FURNITURE.

ILLUSTRATED LISTS ON APPLICATION.——INSPECTION OF SHOW-ROOM REQUESTED.

ST. PANCRAS IRON WORK COMPANY,

OLD SAINT PANCRAS ROAD, LONDON, N.W.

"By Royal Letters Patent."

"Indicator" Dial, 2½ in. diameter.

ELECTRIC BELLS FOR DOMESTIC USE.

BREGUET'S PATENT INDICATOR SYSTEM, with a Dial which shows when the Bell is ringing, the same as in use at the Grand Hotel, Boulevard des Capucines, Jockey Club, &c. Paris.

The superiority of Electric Bells is already settled in America and in France. For all modern works at Paris they have as effectually superseded the old crank and pull plan as, for travelling, the railway has superseded the antiquated stage-coach.

ADAMS & SON have much pleasure in stating that they have made arrangements with Messrs. Breguet, of Paris, to become their sole Agents for the sale and fixing of their Patented Apparatus upon the "indicator system," which has great advantages over all others, and is especially adapted for hotels, public buildings, and other large establishments. The details of this ingenious instrument, together with a description of the various apparatus in use for Electric Bells, may be had upon application, or by post.

WILLIAM S. ADAMS & SON,
Ironmongers by appointment to the Queen and his Royal Highness the Prince of Wales, and also to the principal London Clubs,
Engineers and Manufacturers, 57, Haymarket, and 14, Norris-street, S.W.

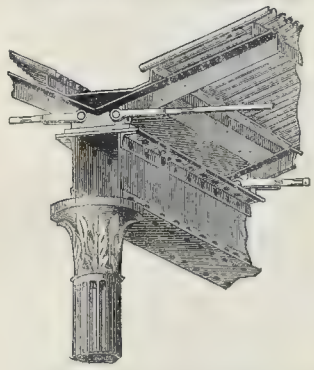
MUSGRAVE'S PATENT STABLE AND HARNESS FITTINGS.

MUSGRAVE'S PATENT HARMLESS LOOSE BOXES. MUSGRAVE'S PATENT IRON COW-STALLS AND PIGGERIES.

Architects who have not seen these Fittings are requested to write for Engravings, as they are unlike those of any other maker, and were admitted to excel all the work of their class in the Exhibition. They can be seen in first class stables in almost every county in England; and MUSGRAVE, BROTHERS, are now fitting several very large establishments under directions of London Architects, noted for adopting only what is the best of its kind. Particulars of these, as well as of MUSGRAVE'S PATENT SLOW-COMBUSTION STOVE, will be forwarded on application to

MUSGRAVE, BROTHERS, ANN STREET IRON WORKS, BELFAST.

THE DENNETT ARCH.



Allowed to be the cheapest fireproof construction known, and used with the greatest success for the last ten years in the Midland Counties, and has been adopted by G. G. Scott, esq. for the New Foreign Offices, used in any form of arch, groin or dome; turned to any length, width, or height, forming a perfect floor and ceiling in one mass, from 2½ inches in the crown to any required thickness.

Address to the Patentees, England and Canada,

A. & R. DENNETT & CO. NOTTINGHAM.

TESTIMONIAL.—"I have made use of Messrs. Dennett & Co.'s material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme convenience of application. I have made use of it in positions in which I should have found it difficult to introduce any other fireproof material, and it has this advantage, that the arches constructed of it are so entirely in one mass that they cover the space like a compact shell or inverted basin, and are, consequently, almost wholly free from lateral pressure.

W. & Co. are the sole importers. These Catalogues can be had free, on application at S. W. & Co.'s Works, 304, King's-road, Chelsea, S.W.

SKETCHLEY'S

IMPROVED SAWING, PLANING, MOULDING, TENONING, REBATING, and GROOVING MACHINE.

Will do more work, and is cheaper and better than any other produced.—Full particulars on application to the Inventor, GREAT GEORGE STREET, WEYMOUTH.

FIRE-PROOF CONSTRUCTION.—

FOX & BARRETT'S PATENT.

This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.

The system combines ECONOMY with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.

The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring boards, or of cement, asphalte, tiles, slate, or other material.

Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great desiderata of fire-proof construction, even for ordinary dwelling houses and domestic buildings, within the reach of every one.

Further information may be obtained of the Proprietor of the Patent,

STOVES, RANGES, RAIN-WATER GOODS, SASH WEIGHTS, AND FURNACE WORK, &c &c

THE PATENT UNIVERSAL CHIMNEY HEAD.

This Chimney Head has been designed for the Prevention of Smoky Chimneys and Down Draught. The numerous side apertures are so placed as to guide the wind upwards, as it strikes the head from any quarter, thus creating a strong current and assisting the exit of the smoke through the top. The same apertures give ready access to the wire brush in all cases in case of its striking downwards from above, and thus greatly diminish the danger of its passing down the chimney.

Price in Zinc..... 22s.

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

DESACHY'S FIBROUS PLASTER.

GEORGE JACKSON & SONS,
HAVING BECOME THE PROPRIETORS OF THE PATENT RIGHTS IN
DESACHY'S FIBROUS PLASTER,
Beg to call the attention of Architects to its Capabilities.

It is adapted for the speedy and economical production of any coffered or circular work, waggon-headed ceilings (all bracketing being avoided, as it is fixed to the joists direct), fluted and plain columns, panelled dados, all kinds of draper, &c.; for the linings of walls and ceilings, and for all purposes of ornamental plaster.

The advantages are great. It is of great lightness and of excellent quality; it is not inflammable, and is ready to be painted immediately after it is made; it has been used under the direction of Owen Jones, esq.) for the ceiling of St. James's Hall; at Messrs. Osler's, Oxford-street; Mr. Hancock's, New Bond-street; the Crystal Palace Bazaar; the Home for the Aged, South Lambeth; and at various other Works.

SPECIMENS CAN BE SEEN AT 49, RATHBONE PLACE.
DESIGNS MADE FOR ANY WORKS.
LITHOGRAPHED DESIGNS OF CEILING FLOWERS, &c, SENT FREE ON APPLICATION.

CARTON PIERRE AND PAPIER MACHE WORKS, 49, RATHBONE PLACE, LONDON, W.
(Established in 1780.)

THE LAND SECURITIES COMPANY

(Limited).
Cap.tal, 2,000,000l.
Directors
The Right Hon. the Lord Naas, M.P. President.
The Directors of the International Financial Society (Limited), acting as a Finance Committee.

John Ennis, esq. M.P.
Sir James Fergusson, Bart. M.P.
Col. Fulke Southwell Greville, M.P.
Sir John Charles Dalrymple Hay, Bart. M.P.
Sir Lawrence Palk, Bart. M.P.
Sir Henry Strachey, Bart. M.P.
William Dargan, esq.
Henry Farquhar, esq.
Sir John Gray.
Thaddeus Wren Hookyns, esq.
John Horatio Lloyd, esq.
Hon. William Napier.
Hon. Henry Petre.
Sir Charles Rich, Bart.
Granville Richard Ryder, esq.
Philip Twells, esq.

Offices.—Chief Office, West End, 32, Charing-cross, S.W.; Branch Office, Office of International Financial Society, No. 60, Threadneedle-street, E.C.

The Company will make advances, repayable with interest, at fixed terms, or by instalments, or by terminable annuities, upon the security:—

1st. Of landed estates, first-class house-property, and real property of all descriptions and tenures, and of all estates and interest therein.

2nd. Of rates, dues, assessments, and impositions of all descriptions, raised or imposed by or under the authority of any Act of Parliament, public or private, Royal Charter, Corporations of Sewers, Drainage, or other sufficient legal authority on the owners or occupiers of land.

3rd. Of charges and securities of all descriptions upon or affecting landed estate, and all real property and tenures, made, given, or issued, under the authority of any Act of Parliament, public or private.

For further information, and forms of application, apply to the Hon. WILLIAM NAPIER, Managing Director, the Land Securities Company (Limited), 32, Charing-cross, London, S.W.

TO BUILDERS AND OTHERS

THE GENERAL FINANCE, MORTGAGE, and DISCOUNT COMPANY (Limited).

Offices: 3, PENTONVILLE-ROAD, LONDON.
PETER GRAHAM, Esq. Oxford-street, Chairman.
Solicitors,
Messrs. BOULTON & SONS, Northampton square.

This Company is prepared promptly to negotiate all kinds of Financial Business, including Loans on good Personal Security, Advances for terms of years on Mortgage of Freehold and Leasehold Property, repayable by instalments; the Discount of good Bills; Advances on Shares, Deposit of Deeds, &c.

The Directors are also prepared to receive Deposits at call or on short notice, for which 5 per cent. will be allowed until further announcement.

E. BALCH, Secretary.

IMPERIAL FIRE INSURANCE COMPANY.

No. 1, Old Broad-street, and 16 and 17, Pall-mall, London.
Established 1803.
Subscribed and invested Capital and Reserved Fund, 1,000,000l.
Losses paid 1,000,000l.

FIRE INSURANCES granted on every description of property, at home and abroad, at moderate rates.

Claims liberally and promptly settled.

Insurances on Stock, Machinery, Utensils, and Fixtures in Trade, effected at a reduction of One-half the Duty formerly charged.

ANDREW BADEN, Superintendent.

GRESHAM LIFE ASSURANCE SOCIETY.

37, Old Jewry, London, E.C.
F. ALLAN CURTIS, Actuary and Secretary.

POLONCEAU and SEYSSEL ASPHALTE.

ESTABLISHED  1838

For covering Flat Roofs, Paving and Flooring of every description, especially in places subject to damp and vermin. This Asphalte is now extensively used for paving stables (as shown above), the absence of joints preventing the generation of ammonia. For Estimates and Prices, &c. &c. apply to JOHN PILKINGTON, 15, Fish street-hill, London, E.C.

Country Builders supplied with Asphalte in Bulk for covering Footings, Barn Floors, &c. with instructions to lay it down.

GRAVEL and HOGGIN,

of the best quality and richest, from the well-known DAWLEY GRAVEL PITS, near Hayes, Middlesex.

To BUILDERS and ROAD CONTRACTORS.

Sifted Stones for roads, unsifted Gravel for concrete, Hoggin for paths, may now be had in any quantity, delivered alongside by the Grand Junction and Regent's Canals

THOMAS MAYNARD, PROPRIETOR
Dawley, near Hayes, Middlesex

GUTTA-PERCHA MILL-BANDS.—The Gutta-Percha Company beg to state that the increasing demand for the Gutta-Percha Strapping for Driving-bands, Labstraps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractibility and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Bosses, Union-joints, Flasks, Bottles, Bowls, Toilet-trays, Curtain-rings, Galvanic Batteries, Talbotype Trays, &c. &c. manufactured by the Gutta Percha Company, and sold by their Wholesale Dealers in town and country.

THE GUTTA-PERCHA COMPANY, PATENTEES,
WHARF ROAD, CITY ROAD, LONDON.

GOULD & PORTER (late CARY) are now manufacturing their improved 10-inch DUMPY LEVEL, best quality, complete for 9l. 10s. 0d.; with silver ring compass, 10l. 10s. 0d.; 13-inch ditto, 11l. 0s. 0d. and 12l. 12s. 0d. Best 5-inch THEODOLITES, 22l. 0s. 0d. All other MATHEMATICAL INSTRUMENTS at Revised Prices — Optical and Mathematical Instrument Makers to the Admiralty, Royal Geographical Society, Royal Military College, Sandhurst, &c. Established upwards of a century —181, Strand, London.

FIRE in GRESHAM-STREET, London, E.C.—Messrs. THOMAS TAPLING & CO. Carpet Warehousemen, &c. will, until further notice, carry on their BUSINESS in the premises, all communicating, at 344, Gresham-street, and 171, Aldermanbury, opposite those of Messrs. Bradbury, Greatorex, & Beall.

MONEY on FREEHOLD and LEASEHOLD PROPERTY, by the MUTUAL LOAN FUND ASSOCIATION

(Incorporated by Act of Parliament, 18 & 19 Vict. cap. 14), RUSSELL STREET, COVENT GARDEN, W.C. Advances from 10l. to 1,000l. upon Freehold and Leasehold Property, for any term up to ten years. Mortgages redeemed, and the advance can be repaid by easy instalments. Facilities afforded to tenants to purchase the houses they occupy, and the repayment of the advance taken as rent. Greater advantages are offered to borrowers than in building societies, there being no shares to subscribe for, or competition for an advance, and no deduction from the loan. No preliminary fees. Prospectus and forms of proposal sent on receipt of a directed stamped envelope

EDWARD HARPER, Secretary.

The Builder.

VOL. XXII.—No. 1134.

The Tower and Spire of the Cathedral Church of Salisbury.

THE proposition to underpin the tower and spire of Salisbury Cathedral has been received by the public with astonished applause, as though a work of the like nature had never been performed before; while, in truth, twenty years have scarcely elapsed since the same thing was done to the tower of Hereford Cathedral, under the auspices of the late Mr. Cottingham. At that time the tower of that edifice, with its decorated lantern, was in a perilous condition, owing to the instability of the four piers upon which it rested. These were evidently giving way. They were huge clustered Norman piers, faced with ashlar, but filled in with mere rubbish, not having been intended to carry aught but the low square Norman tower originally built. An attempt had been made to avert the danger some years before, when the fashionable Mr. Wyatt was called in, who built a square pillar in the centre of each arch between the piers, under the erroneous impression that some of the weight would be thus taken off the shoulders of the four crumbling supports of the tower. But this remedy, besides having the effect of blocking up the views of the interior of the edifice in every direction very materially, only made matters worse, and increased the thrust that was clearly about to involve the fall of the tower. When consulted by the dean and chapter, Mr. Cottingham conceived and successfully carried out the scheme of building new piers of sufficient strength to bear the superincumbent mass. The tower was elaborately and carefully shored up, and then one of the piers was removed. Whilst the enormous pile was thus resting on three legs, a deep foundation, much lower than that of the first builder's, was laid in concrete, and a new sufficiently massive pier, of solid masonry cramped together, was built upon it, of the same outlines as that removed. When this was completed, a second pier was taken down, leaving the tower to rest upon the new one and the remaining two old ones. When this was built up, the third and fourth were successively, and as carefully, removed and replaced with new. The shorings were then taken down, Mr. Wyatt's superfluous and disastrous additions displaced, and the ancient tower, unshaken, uninjured, and unaltered, reposed upon the four new piers.

The declination of the beautiful tower and spire of Salisbury is no new matter of regret. For two hundred years it has occupied the attention of the successive officials, and been watched with commendable solicitude. In 1668, an unusual thunderstorm intensified the alarm that was felt for its safety, and induced Bishop Ward to call in Sir Christopher Wren. He directed that some of the timbers should be removed, so that a plummet might be made to fall from the highest point to the pavement, and that this trial should be repeated after some interval, so that it might be seen whether any further declination was made. In 1681 Mr. Thomas Naish, clerk of the works, commenced a series of observations which were carried on by his son down to 1736. Mr. Naish caused a staple to be fixed near the weather door, in the north-east angle of the octagon, from which a plummet was let down to the pavement. A mark was made upon the floor to indicate the spot it touched on the occasion; and as, whenever this test was repeated, the same result was given, it was ascertained that no continuous change in the declination was taking place. In 1737 a new method was tried to ascertain the extent to which the pile had passed from the perpendicular. The bishop called in Mr. James Mill, who proceeded to ascertain the true centre of the four piers, or, as they were called in his day, "the four grand legs." On the 18th July, 1737, the bishop and a numerous party witnessed Mr. Mill's method of proceeding. A line was drawn due west from the centre of the piers, and another due north. At the extremity of the northern line a triangle of poles was raised, from the top of which a plummet was lowered into a vessel of water, and the poles and water-vessel were moved till the plumb-line was deemed to rest upon the north line. A candle was then placed upon the west line, and moved till the persons standing behind the triangle of poles could see the capstone or ball of the spire and the light of the candle exactly cut by the plumb-line. The centre of the candle was then marked upon the pavement. It gave 16½ in. as the total declination of the structure to the west. The same process repeated nine days afterwards, before the same spectators, gave 24½ in. to be the declination to the south. In 1739, Mr. Naish ascertained that in the fifty-eight years that had elapsed since his father made the first measurement, not the least increase had been made to the decline.

About this time there was a prophecy in circulation to the effect that the whole structure would be destroyed in 1742. This incited Mr. Francis Price, who was then surveyor to the fabric, to make a most minute examination and survey of it. It will be remembered that Mr. Price was the author of "The British Carpenter," and a man of considerable discernment, taste, and practical ability. He was firmly impressed with a conviction that the tower and spire were the work of a second architect; and that it was not in the perpendicular from its erection. He thought that the death of the first architect must have taken place before the "lesser ornaments" were completed; but not before a great settlement had taken place, which was remedied, as far as possible, by the insertion of iron bands and braces in a great many places. Upon the building of the tower and spire further settlements took place. At a certain stage of the tower Mr. Price noticed the marks of a scaffold. Where the timber had been the walls were white and clean, the intermediate spaces being green; thus demonstrating that it must have remained for a considerable time at that stage to have been so marked by the weather. Part of the settlement in the tower he attributes to the fact that the south and west sides being most exposed to rain, did not dry so quickly as the other sides, and hence occasioned a declination. The principal cause, though, he believed to be the insufficiency of strength in the points upon which it rested. The decay of some portions of the fabric he traced to a curious custom observed at Whitsuntide, when a fair was held within the cathedral close. As many as eight or ten persons at a time were allowed to climb the spire; and still larger numbers spread themselves over the roofs and gutters. These seldom descended without cutting their names in the leadwork: as this was meant to be a sign immemorial of the ascent of each individual, they cut so deep as to cut through the lead, leaving the rain to make its way through to the timbers. His opinion was, however, that no extra settlement had taken place for more than half a century, and that future damage might be averted by a proper application of iron. Various repairs were made to the structure whilst it was in his care, which gave him full opportunity to get within reach of every part of it. He availed himself of his unusual opportunities, took numerous measurements, made note of every fracture, and published the result under the title of "A Series of particular and useful Observations made with great Diligence and Care, upon that admirable Structure the Cathedral-church of Salisbury." The Bishop of Sarum placed a MS. in the hands of our surveyor, which contained a narrative of the building of the edifice, by the precentor; and he also had access to Sir Christopher Wren's survey. With these materials he made a very readable volume; somewhat circumambient and reiterative, perhaps, but still couched in terms which left no doubt that if he were not quite up to his subject as an archæologist, he looked upon the edifice with as an affectionate admiration as that which the editor of Camden's history ungrammatically expressed for it:—"Its high steeple and double crosses, by a venerable kind of grandeur, strikes the spectator with a sacred joy."

In the year of grace, 1218, the Dean and Chapter of Old Sarum had despatched special messengers to Rome, to represent that their church was inconveniently situate within the bounds of a fortress, and that the faithful could only have access to it by the leave of the castellan, which he occasionally refused, declaring that the safety of the fortification was imperilled by the admission of concourses of people. The situation, too, they urged, was so exposed, that they could hardly hear themselves speak for the wind; and water was very scarce,—so scarce, that they purchased it at as great a price as would have bought them the common drink of the country. The Pope, in reply, granted the Dean and Chapter leave to translate the church to another convenient place. Upon this they erected a wooden chapel at New Sarum, for temporary need, which was commenced on the Monday after Easter, and on the Feast of the Holy Trinity was so far completed as to admit of the celebration of divine service in it. And in the year 1220, on the day of St. Vitalis, the martyr, the foundation of the existing edifice was laid in the presence of a great multitude. The bishop expected that the king, with the Legate and Archbishop of Canterbury, would have been present at the ceremony, and prepared a great feast for them; but in this he was disappointed. The ceremonial, however, appears to have been sufficiently imposing. After the celebration of divine service, the bishop pulled off his shoes, and went in procession with the clergy of the church to the place of the foundation, singing the Litany. This being ended, and a sermon having been preached, the bishop laid the first stone as deputy for the Pope, the second as the deputy of the Archbishop of Canterbury, then on the Welsh Marches with the king, and the third for himself. The fourth stone was laid by William Longspee, Earl of Sarum, and the fifth by his pious countess. Several of the nobility also were permitted to lay stones; and the dean, chantor, chancellor, treasurer, archdeacons, and canons went through the same formality. It must be also mentioned, that as the nobles returned from Wales, whither they had accompanied their sovereign, several of them bent their steps to the new fabric, laid stones, and bound themselves to special contributions for seven years. The canons also bound themselves to contribute certain sums for seven years on specified days; but as the bishop computed that these would be insufficient, he appointed preachers or collectors of alms to visit other bishoprics and gather aid from every possible source. Everything prospered so happily, that on the day of St. Michael, in the year 1225, divine service was celebrated in the new fabric. On the vigil of this day the bishop consecrated three altars in the cathe-

dral; that at the east to the honour of the Holy and Undivided Trinity and All Saints; that in the north part in honour of St. Peter and the Apostles; and that in the south to the honour of St. Stephen, the proto-martyr, and the rest of the martyrs. Offerings flowed in. The king, accompanied by his justice, Hugh de Burgh, came to service in the new edifice on the day of the Holy Innocents, and offered a gold ring with a ruby in it, a piece of silk, and a gold cup of the value of ten marks. The ruby and the gold of the ring were to be used, he directed, in ornamenting a copy of the Old and New Testaments previously presented by the justice. Only a few months after this, the Earl of Sarum, who had laid the fourth stone of the noble pile, was brought to it for burial; and a short time afterwards three bishops who had been buried in the old church were translated to this.

Sir Christopher Wren, in his report of the state of the building, took occasion to mention that he believed the tower and spire to be the work of a second architect. He wrote, "The whole church is vaulted with chalk between arches and cross-springers only, after the ancient manner, without orbs and tracery, excepting under the tower, where the springers divide, and represent a sort of tracery. And this appears to me to have been a later work, and to have been done by some other hand than that of the first architect, whose judgment I must justly commend, for many things, beyond what I find in diverse Gothick fabricks of later date." He particularly admired the pillars with their marble shafts bound to them:—"These pillars show much greater than they are, for the shafts of marble that encompass them seem to fill out the pillar to a proportionable bulk; but, indeed, they bear little or nothing, and some of them that are pressed break and split; but this is nowhere so enormous as under the steeple, which, being 400 ft. high, is borne by four pillars, and therefore out of fear to overburden them, the inside of the tower for 40 ft. high above the nave, is made with a slender hollow work of pillars and arches: nor hath it any buttresses; the spire itself is but 9 in. thick, though the height be above 150 ft. This work of pillars and arches within the tower makes me believe that the architect laid his first floor of timber 40 ft. higher than the vault beneath; which, as I have said, was since added, and *so would have concluded without a spire*. And if this addition was a second thought, the artist is more excusable for having omitted buttresses to the tower, and his ingenuity commendable for supplying the defect, by bracing the walls together with many large bonds of iron within and without, keyed together with much industry and exactness. And besides these that appear, I have reason to believe that there are divers other braces concealed within the thickness of the walls." The iron band embracing the upper part of the arcade of the tower was long looked upon as the best piece of smith's work, applied to construction, in Europe. There are seven bandages of iron encircling the spire. In some cases the iron bands are soldered in sheet lead, but this has not always prevented them from rusting. The parapet wall at the stage of the tower, known as the eight doors, was, at the time of Price's survey, lifted up by the expansion caused by damp. Various dimensions of iron bar are used, the most usual being 2 in.

The materials used in the construction of this stately edifice are Chilmarke stone for the walls, buttresses, ribs, and groins, and Purbeck marble for the pillars and shafts. The shell or vaulting between the groins and ribs is formed of hewn stone and chalk mixed, over which is laid a coat of mortar and rubble, which has the appearance of having been ground in a mill and poured on hot whilst the lime was bubbling: it has the effect of cementing the whole together. The foundations were laid with especial care, as springs of water abounded upon the site and in its neighbourhood. Mr. Price ascertained that 3 ft. below the ancient surface of the ground, near the cathedral, lies a statum of dark gravel, and under that a greenish bed of sand, which, if disturbed, is immediately flushed with water. The foundation of the church, composed of flints, chalk, and rubble (probably carried from the old city), are laid upon this stratum of gravel. The proximity of springs was at one time a source of damp; for the water used to force its way up between the paving-stones, and flood the church. But this disaster did not affect the structure in early days; nor does it now. It is supposed to have arisen from the formation of locks or alterations in the course of the river Avon. As the waters were sometimes pent up at a great height by means of these locks they prevented the springs in the neighbourhood of the close from emptying themselves in the usual manner, and obliged them to return and force themselves a passage where they could make one. This serious inconvenience was cured by a new cut made by a gentleman through his estate for the purpose of irrigating it, and which had the unexpected effect of effectually draining the whole neighbourhood.

The walls of the tower, at the stage from which the spire rises, are 5 ft. thick. The spire occupies two of these feet, a passage-way from the staircases in the angles two more, and the parapet the fifth. Commencing with a thickness of 2 ft., the spire gradually tapers to 9 in. only. We quote the admiring surveyor:—"I cannot omit mentioning the architect's particular and curious invention, for adding artificial strength without overburdening the former work. He contrives, in the cavity of the spire, a timber frame, consisting of a central piece, with arms and braces. This timber frame, though used as a scaffold while the spire was building, was always meant to hang up to the capstone of the spire, and by that means prevent its top from being injured in storms, and so add a mutual strength to the shell of stone. The central piece of timber is not mortised to receive the arms which served as floors, but has an iron hoop round it, with hooks riveted through; and upon these hooks a flat iron bar is fitted, with a hole in it, which is fastened on to the brace: the upper part of the brace is mortised, and the arms tenanted at the end, to slide into and through the mortise in the brace; so that by a key or wedge on the outside of the brace, the connexion is made complete, the central piece and the other end of the arm being provided with iron, as before, renders it the most complete piece of work imaginable; nor is its connexion at the top inferior to it. The said arms and braces may be taken out and put in at pleasure, consequently capable of an easy repair. It was before said, that this timber frame served as floors, or scaffolds, till the work by its tapering, or diminishing, became too small for the men to work in the inside; and therefore, we must suppose, that they at last made a scaffold on the outside, by thrusting out timbers horizontally, which were tied down in the inside to the central piece. It is probable, that when the sides of the spire drew near together, so as not to admit of timber floors, then the artists began to think of tying all the timbers up to the capstone of the spire; and for this purpose cross bars of iron are yoted into the walls of the spire, so that the standard of the vane has hooks to hang them up by, and at the same time is fixed to the upper part of the central piece, in a most extraordinary manner." In 1738, the arms, braces, and central piece were all repaired. The latter was broken in the solid at a point where a sudden bending in the spire was very apparent, the consequence, doubtless, of some violent windstorm.

There must necessarily be a large number of our readers who will never climb this airy height, nor even view "the four grand legs" heading beneath its weight, now under public consideration. To them we offer these notes as information that the familiar photographs and engravings cannot convey.

Although the great underpinning work at Hereford was done, it was not easy to do. For several weeks a numerous band of workmen were engaged, by *night* as well as day, without interval, in shoring up the tower with a very forest of timber. It was never left unwatched. Hundreds of tons of timber in balk, needle-shoring, and upright and raking supports, were applied, and the interstices between them and the parts of the tower they were intended to sustain were carefully wedged in; and these wedges were scrupulously watched and kept so tight and firm as not to permit the least movement in the ancient masterpiece. Should it be determined to treat the Salisbury work in the same way, the utmost caution, tact, and skill will be required in the supervision; for the spiral form of the mass and the great height and slenderness of the piers will make the task still more delicate and difficult.

Testimonial.—A service of plate, weighing 1,000 ounces, and of the value of 650*l.*, has been presented to Mr. J. C. Forsyth, engineer of the North Staffordshire Railway, and also for some years general manager of that line, by a number of Staffordshire gentlemen.

THE STEAM-BOAT PIERS, AND THE LANDING-STAIRS, IN THE THAMES EMBANKMENT.

The space that we have given to the subject of the Thames Embankment,—not disproportionate with the work itself, or uncalled for by the interest taken in it by Londoners,—has enabled us to supply particulars of the general structural and decorative features of that portion of the northern line which is in actual progress; whilst those of our articles on the sewerage of London which have treated of the Northern Low-level, have contributed to that complete body of information as to the connected works, which might be expected to be found in our pages.* But the steam-boat piers and landing-stairs, the most important features of the line decoratively considered, we have alluded to without having adequately described; and there are structural arrangements in connexion with some of them, or all, that alone would deserve attention.

The condition of the landing and embarking places on the Thames, was, till recently, much more discreditable to London than anything connected with the street-communications. To the line of ugliness which bounds, on either side of the river, the expanse of water and of mud, there was no mitigation in the several substitutes for piers that were formed of dilapidated barges and shifting gangways, and which were obstructive to the navigation, and inconvenient, if not dangerous, to passengers. The result was a considerable deduction from the realized value of the chief thoroughfare of the metropolis. The first great improvement upon the old arrangements, was the work of the late Mr. Thomas Cubitt, a man who did everything but architectural art-work, certainly in first-rate style; and who in the Pimlico Pier, near his place of business, produced something that was at least safe and commodious. Prior to this, another private work, the Cadogan Suspension-Pier, had been constructed; and it was a considerable improvement at the time, though some of the arrangements in connexion with the barges there were bad. The Hungerford Pier, also, being served by the footway of the bridge, was better than the landing-places generally. But, the representatives of the public, the City authorities (the Lord Mayor being Conservator of the Thames), did nothing till the construction of the pier at Blackfriars. After that effort, things remained till the present Board of Conservancy was appointed pursuant to the Act of Parliament. Under this Board, great improvements have been made, to which some of our contemporaries having in mind the former, rather than the existing, state of things, have not done justice. The landing-stages and light iron bridges, as at Paul's Wharf, London Bridge, and Battersea Park, seem to us nearly as good as the arrangements could be in the absence of a quay-wall, and of better accesses from the streets and places adjacent. There is some advantage in the arrangement which allows of vessels laying-to on both sides of the barge, pontoon, or "dumby," as may be seen every day at the Hungerford Pier. In the new steam-boat landing-places, the "dumbies," which rise and fall with the tide, will lie in recesses, formed by pedestal-piers, generally projecting from the embankment, or rather from the line of stairs which themselves will descend parallel with, but outside of, the general line of the embankment-wall. By the new connexion of the water-highway with a highway for pedestrians and carriages, extending on the north side, from Chelsea to Blackfriars, (excepting the space occupied by the Houses of Parliament, Abingdon-street and Millbank-street),—and which may be afterwards carried further in the direction of London Bridge, in accordance with one or other proposition of the number made in the period of twenty-four years commencing with the plans of the late Mr. Walker, and including those of the Metropolitan Board of Works,—and by the embankment of the south side of the river, the plans for a portion of which are now in hand,—the river, and its capabilities as a highway, will become known and appreciated as they have never been before. With improvement in the steam-boats, and better regulation to avoid delay, both much needed at present, the number of passengers by the water-route will be increased, even after the valuable provision of the new land-route. It is, therefore, important that these landing and embarking places should have been well considered, as we may hope they have been.

* See pp. 521, 537, 553, 573, 627, *ante*.

The landing-stages for the steam-boat traffic which are included in the work now in hand, or between Westminster Bridge and the eastern side of the Temple, include works at Westminster Bridge, Hungerford, or Charing-cross Bridge, Waterloo Bridge, and the western side of the Temple. Besides these works, there will be stairs for smaller craft, at a point between Westminster and Charing-cross Bridges; at a second point, nearly opposite the Adelphi; and at a third point, or forming part with the Temple landing-stage. The arrangement at Westminster Bridge will comprise a single recess with barge, or "dumby;" that at the Temple will be similar in plan, landing-stairs, however, being added to the ends, and the decorative accessories being different; whilst at Charing Cross and Waterloo Bridges, in each case, there will be two recesses, one above bridge, and the other below, attached to the pier of the bridge.*

The position chosen, in connexion with the bridges, had obvious recommendations, and may have been the best; but the pier of the bridge will so cut off one landing-stage from the other, that the stages may require to be under separate control. Whether this circumstance, together with, at Waterloo Bridge, the limited head-way next the pier at high-water, will cause inconvenience, or tend to accidents, we cannot at present say. Doubtless, the piersmen have been consulted; and the approval of the Board of Conservancy must have been obtained. The arrangement of two landing-stages, it will be seen, is quite different from that of the stage under the arch, on the Surrey side, of London Bridge, which is most convenient for passengers, whatever obstruction it may be to the navigation. Mr. Bazalgette's original design for the stages at Waterloo Bridge, to the architectural features of which, however, we were compelled to object, had the advantage of a direct communication from one landing-stage to the other, or under the arch. When making his second design, and setting back the face of his embankment from the objectionable line for which Parliamentary powers had been given, he might, we are disposed to think, have considered whether it was desirable to set the line back so far, by 4 ft. or 5 ft., and whether some such dimension might not have been usefully apportioned to a communication such as we have referred to. At Charing Cross Bridge, the inconvenience from want of a direct communication may not be quite so great as at Waterloo; and the Act did not allow an advance beyond the pier. The arrangements and architectural features of the Charing Cross Bridge and Waterloo Bridge landing-stages, are precisely similar, excepting what may be due to difference between the bridges, and to sculpture surmounting the pedestals, which is yet undecided upon. The arrangement at Waterloo Bridge has been the subject of a view which accompanied one of our articles.

Each of the steamboat piers, as well as each of the landing-stairs, includes in the work much that has involved elaborate contrivance, but will be quite out of sight. We described in our last preceding article, the construction of the storm-water outfall of the Northumberland-street sewer, which will be situate in the middle of the up-stream one of the two recesses at the Charing Cross Bridge, and the precisely similar arrangement of the outfall of the Savoy-street sewer in the recess above Waterloo Bridge. Beyond these matters of "special construction," however, there are certain provisions in each of the recesses of the steamboat landing-stages, and in the case also of each of the landing-stairs of the other description, for flushing and cleansing the beds and spaces where deposit could accumulate. And in the case of the Waterloo Bridge landing-stages, the foundations of the recesses and embankment-wall having to be carried down lower than the foundations of the pier of the bridge, a particular structural provision for the maintenance of this bridge-pier had to be contrived.

Thus, it will have been understood, that there are in the line of the embankment, six different places at which there are "special construction" and decoration which we have to notice. At four of these six places, there will be landing-stages for steamboat passengers; at the other two there will be stairs with architectural features and sculpture: with one of the four steamboat landing-places, stairs for smaller craft will be combined; two of the four, will be as near as may be, repetitions of one another, as seen, and will comprise each two distinct recesses and stages; and two of the four, namely, those at Westminster and the Temple, will have one large recess only. It will be convenient to describe the steamboat piers first; and to begin with the work at Westminster Bridge.

This work, of which the architectural features, as mouldings and lamp-pedestals, continue the character of those of the bridge, is designed with a recess of 250 ft. in length, and about 18 ft. in the other dimension. The "dumby" itself will be 250 ft. by 25 ft. at the ends, thus projecting about 7 ft. into the stream. A central space of 90 ft. out of the 250 ft. length will be still further recessed, or 11 ft.; and, with this central space,—the rear-line of which, on plan, is that of the outside of the parapet of the footway of the embankment,—two of the customary light iron bridges will be connected, rising right and left to the level of the footway, which at this point will be about 13 ft. 6 in. below the level of the footway of Westminster Bridge. The embankment-footway and the end of that one of the iron bridges which is nearest Westminster Bridge will terminate in a wide platform-landing, whence the ascent to the level of Westminster Bridge will be by twenty-seven steps of 42 ft. 9¼ in. width between parapets, broken into three flights and landings. The steps are to be of Wingerworth stone, in lengths of 6 ft. 3 in. dowelled together with slate. The carriage-way of the embankment-road, of course, has to descend by a gradual incline from the level of the bridge to the general level of the embankment; so that, for the whole length, 66 feet 9 inches, of the flights of steps, 250 feet of the recess, and about 42 ft. 9 in. further, there will appear a separate retaining-wall and parapet to the carriage-way, beyond and above the footway. The incline will be 1 in 80. It should be understood, that in the case of the Westminster steam-boat pier, the recess will be taken wholly out of the embankment, instead of out of a projection into the river, which has been described as the general arrangement for the piers and landing-stairs. The subway and the sewer are under the footway, as described in previous articles; and below the sewer at this point, is a separate 4 ft. culvert, to which reference will be again made. The line of the embankment corresponds with the abutment of the first arch of the bridge, and with the line of embankment of the Houses of Parliament. The masonry of the new work, and of the bridge, will be bonded, and made to range in courses. The foreshore, for the area of the recess, will be paved, on concrete, with granite laid to a fall from the back of the recess. The space underneath the broad flights of steps leading to Westminster Bridge, will be formed into a reservoir, to be arched and groined over. The spaces which will be beneath the iron bridges, will be arched over similarly, and the top inclines will be paved with granite. In the space, below the incline, next the reservoir, will be fixed three sluice-valves; and there will be a similar one in the centre of the 90-ft. middle recess. By the combined arrangement of the reservoir, the 4-ft. culvert which has been mentioned, and four outlets to which the sluice-valves will be fitted, the floor of the recess can be scoured at several points. The outlet-ends to the piping are to be cast, flattened, each to an opening 4 ft. wide and 9 in. high. Proper means of access to the reservoir and sluices are provided. The spindles of the valves will be turned by keys from above. We may infer that the water for flushing will be obtained from the river; but the drawings and specification do not make that matter quite clear. The granite paving of the recess will be in blocks of 12 in. by 12 in., by 4 ft. in length, bedded and jointed in cement and laid on 18 in. of concrete. The toe of the slope will be laid upon a dwarf brick wall, and will be further secured by a mass of concrete in front.

For the Charing Cross Bridge and the Waterloo Bridge steam-boat piers, the description of the latter of the two will suffice. For each landing-stage at Waterloo Bridge, the arrangement is precisely the same; but we may mention that the total length of the work in connexion with the two recesses, taken through the arch of the bridge, appears to be about 552 ft. The leading dimensions of the length, measuring from centre to centre of the four pedestal-piers, two of which form the ends of a recess, are 19½ ft., that dimension repeated, and 98 ft. 3 in. for the distance measuring through the arch. The line of the footway of the embankment-road, or inside of base of parapet, is placed 15 ft. within the first arch and pier of the bridge: thus, the masonry of the recess for the landing-stage, although projecting from the embankment, does not advance into the river beyond the pier of the bridge; and the pedestal-piers, the ends of the recess proper, do not advance so far. The pier of the bridge is 20 ft. on the face. The long recess, in each case, for the pontoon, will be about 180 ft. in length; and the disposition of the inclines, where the iron bridges will be, is the same as in the Westminster Bridge case; though instead of a central recess of 90 ft., from the larger one, there is one of not more than 17 ft.; and it is flanked and backed by pedestals. These, with the end pedestals, we may suppose are intended to support large groups of sculpture, as indeed they were shown in the drawings exhibited in the Royal Academy, and in the view that we engraved. The general depth of the large recess, if measured on the granite apron, the front of which corresponds with the springing of the second arch and the face of the pier of the bridge, would be 22 ft. 1½ in.; or the depth would be 33 ft. 1½ in. in the centre: but the pedestal-piers are 6 ft. or 8 ft. within the front line of the apron. The contract-drawings now before us, show only the piers, with splays and sets-off, which will form the substructure to the pedestals proper: so that we may hope that the forms and decoration of the latter are still open to reconsideration. In the masses of the supports themselves, however, we could have desired somewhat more art than there is in the mere bulk, and the splays and sets-off, and in the merely placing the end-piers at right angles to, and the central group parallel on plan with, the line of the embankment. The lower mouldings of the general line of the embankment will be continued on the face of the screen-walls of the inclines where the iron bridges are; but those walls, and the embankment-wall also for the same length, will be finished with a balustrade in place of the general parapet.

In lieu of an arrangement, such as was described in the case of the Westminster Bridge landing-stage, for flushing from a reservoir, there will be a culvert, 7 ft. by 8 ft., carried between the embankment-wall and the screen-walling at a level corresponding with that of the top of the incline of the apron-piece. This culvert will run from end to end of the entire arrangement of the recesses, and passing at the back of the pier of the bridge, to admit free passage of tidal water; whilst fourteen outlets, each 3 ft. by 3 ft., will be formed in the lower part, or base, of the screen-walling of each recess. Two other culverts, each 3 ft. by 4 ft., will be formed through each of the projecting pedestal-piers.

We must defer the completion of this account till our next number.

* The common use of the term *pier*, in different senses, involves some difficulty in description. Such difficulty is not unfrequently caused by architectural nomenclature.

ARCHITECTURE AND PAINTING.

THERE can be no doubt that the tasteful arrangement and display of the primitive colours without any attempt at the admixture of half-tints or shadows, afford pleasure both to the artistic and uneducated eye. Look, for instance, at the fragments of the wall paintings which are still left to us for study by the nations of antiquity,—Egypt, Assyria, Greece, and Rome; and also the examples of the early dawn of art in this country, exhibited in the pictures which adorn Mediæval and other manuscripts of a more recent date, and to be met with on some of the walls of our churches and cathedrals. In the emblazonment of heraldic devices, the chief charm consists, so far as colour is concerned, in perfect simplicity; and the unqualified use of distinct colours applied to peculiar forms; and the same remarks will hold good in specimens of old stained glass left to us in our ecclesiastical and domestic buildings. But in the best examples of this early kind of decoration, there is to be seen an arrangement of the colours which produces a pleasant harmony: this is especially to be noticed in the general aspect of the chapter-house of York Cathedral. Many other instances of harmony of colour may be met with at home and abroad, which are as agreeable to the eye as the choicest music is to the ear.

In tracing the progress of art generally, it is singular to notice the lame attempts of delineators to introduce perspective, light and shadow, and a correct manner of drawing, particularly of objects which require to be shown in a foreshortened or round form. Not-

withstanding, these draughtsmen had all the materials in a substantial form constantly before them as lessons in perspective. They had the long, solemn aisles, and other splendid portions of religious and monastic buildings; the picturesque interiors and exteriors of baronial halls and castles, and the architectural and ornamental sculptures of the old times, which should, one would have thought, have had an effect upon pictorial art sooner than they did.

From the time of the decline of a pure,—or, what had better be called,—simple outline, until the date when a picture was produced which could be considered tolerably complete in all its parts, there was a great deal of fumbling, and generally the middle stage works were much worse than the first; and it would seem, at a first glance, remarkable that such rare examples of architecture, and such marvellous skill in sculptural ornamentation, should have been achieved so long before the hand-drawing of men had arrived at any degree of perfection.

We look admiringly at the delicate tracery of the Middle Ages, the cunning diapers, the exquisitely chiselled foliage and flowers, the ingenious interweaving of the forms of human creatures, beasts, birds, and fishes with heraldic devices and other designs, and wonder that, although art in this line had been so much developed, such poor results were produced in colour.

There must, in the old times—five hundred years or so ago—have been a fair knowledge of geometrical drawing; and it may be that one day there will be turned up amongst the archives of some of our cathedrals plans which may show how the master-masons, carvers in wood, and other workmen were instructed in carrying out those works which exhibit, to such a remarkable extent, a spirit of originality.

Having thus glanced at the slow use of the perspective lessons which might have been taught by architecture to the ancient limners, it is worth while to note how in like manner they neglected the hints at light and shade which were afforded by the same means; for there can be no doubt that those old church builders had ideas of light and shadow. Note in some of those structures how the sunshine and bright light stream in the proper places; how they illuminate altar-screens and other important points; and how these are the more boldly thrown out by deep transparent depths beyond: mark, for instance, the altar-screens of St. Alban's and Westminster abbeys. Or it may be that this part of the church is thrown into a half-tint, which shows out the gold and silver fittings of the altar by means of a flood of light passing into the chapel beyond. Take the screen of Durham Cathedral as an example of this. Few painters of even the present day would be likely to conceive anything so magical as the intermingling of gloom and light between the Confessor's and Henry VII.'s chapels at Westminster: here there are depth beyond depth, and lights of various degrees, which wander about and imperceptibly are lost in the shadows. There were also crypts and other suggestive matters; but these, like the perspective teachings, were not quickly made available. If, then, we consider all this, and compare the architecture and sculpture of ancient nations with the pictorial illustrations, it will be seen how very youthful a sister painting is.

It is most interesting to study,—and there are some very good opportunities afforded for this purpose in the National Gallery,—the transition from the style of the old illuminated books and the church-wall paintings to those works which come within our present idea as pictures; and then to note the advancement of refinement in the art of composition, perspective, colouring, light and shadow, and the other elements of pictorial art. In the latter pictures we find the qualities which were formerly to be met with only in nature or in the architect's works;—we find upon the canvas, not only truthful perspective, but the delineation on a flat surface of objects thrown out with a proper degree of point: parts of scenes which would in nature offend the eye, are cast discreetly into shade; the beauties are brought out by means of colour, and shadows and lights; colour is made to mingle with colour; grey neutral tints play about, foiling the richer hues and giving refinement; the sunshine, as is the case with the entrance to Henry VII.'s Chapel, is made to play into the darkness; and we have combinations which, being perfectly harmonious, produce a beauty that is enchanting to the senses. Even beauty, however, will not make amends for the absence of thought and expression.

THE FINE ARTS IN CONNEXION WITH THE CHURCH.*

One of the very great advantages of *réunions* such as the present is, that we are enabled to take stock of other things than those immediately set forth in the prospectus; and I therefore most willingly seize the opportunity to examine as to the state of the fine arts in connexion with the Anglican church. Of course, the subject resolves itself into what we have done, what we are doing, and what we may reasonably be expected to do. Now, as to what we have done. It is some twenty years or more since the Cambridge Camden Society took up the subject of Mediæval architecture. Pugin had done much, but no one man can ever pretend to direct so great a subject as a change in our architecture. The Camden Society went into the breach, and, by means of a series of most useful papers, containing the results of the experiences of the many, and also by means of the most unsparing criticism, it succeeded in getting us to build tolerably decent churches, *i.e.*, churches which as regards the exterior looked very like old ones. Not that it required any particular talent on the part of the architect to do so, for the directions for a regulation church are very plain, and may be easily found by an attentive perusal of the *Ecclesiologist*; and, indeed, so easy has the subject become, that I venture to say that almost any young architect of the present day who has been two years in an office, can design his regulation church. Another great occupation was the restoration of old churches. I do not know whether I ought properly to call this a restoration or a destruction, for so much injury has been done under this pretended restoration, that I do not hesitate to declare that we have lost a great deal more than we have gained under this head. There is really no more difficult problem in the whole practice of architecture than that of restoration; for, a man to succeed thoroughly in it, must be not only versed in modern and ancient construction, but must also be an antiquarian and something of an artist. Yet how often do we hear of young men just out of their apprenticeship, and with good connexions, beginning life with the one or two churches to build, and five or six more to restore. Of course, the new churches do not matter very much; for, as I said before, church building is the sole thing taught in an office; but it is a very different thing as regards the restored churches, in each of which we run a chance of losing some landmark in the history of architecture. So often, indeed, has this happened, that, as a general rule, when one hears of a church having been restored, it is hardly worth going to study from. What really is wanted in the restoration of a church, is to do as little as possible. Keep it together if it is possible. If an aisle or tower is tumbling down, rebuild it, using as much of the old materials as possible, and inserting a small inscription to record the fact. Should there be any money to spare, employ it in a work of art as good as you can get for your money, *i.e.*, one stained glass window, a dossel, or a painting on a wall or roof: but then get it good, and let it tell some story: in fact, let it be such that an artist would think it worth his while to turn out of his way to look at it. As it is, we fill our churches with stained glass which a future generation will probably break to pieces; and if ever we do see a piece of sculpture, we may be sure that it is of the most mild description. The figures tell no story, for they have no expression in their faces, and do not appear to know what to do with their hands. Their hair also is most carefully arranged, and their noses and other features are of the most regular and unmeaning description. But to return to the new church. As I said before, the exterior is generally very like an old one, and that old one of the village type; it is only very lately that we have become aware that town and village churches require very different modes of treatment. But suppose we open the door, and go inside,—what do we see? Generally nothing at all beyond a mass of seats and a few inferior stained-glass windows, and very happy indeed are we if these latter do not positively offend the eye by their raw colouring, to say nothing of their bad drawing. The walls are plain plaster, and the roof looks like a scaffolding, so thin and meagre is it. Now, in the edifices up to the fourteenth century, I very much question whether that desideratum of ecclesiologists, an open roof, ever obtained in churches. Look at ancient twelfth and thirteenth century buildings that have not been restored, and you will find an hexagonal ceiling, the said ceiling in many places replacing the old boarding; but in some poor places, as in the little Sussex churches, it may just as likely have been original. In many instances the ceiling was even flat, or very slightly canted, as at Peterborough, Jesus College, Cambridge, and, I believe, Adel Church. Now, this boarding was useful in two ways; it afforded a surface for decoration, and it kept the church cool in summer and warm in winter. There was also a small window high up in the gable, to ventilate the air between the ceiling and roof. In our modern open roofs we have just the reverse; they are frightfully hot in summer, and cold in winter. Go into a church after a Sunday's afternoon service, and observe how close it smells. Our modern architects put the little window in the gable because they find it there in the old examples; but with them it is of no earthly use but to afford light where light is not wanted, and to show the thin scantling of their timbers.

Another important point is the treatment of the walls. No one in his senses supposes that all the Mediæval churches were decorated in brilliant gold and colours, like the Sainte Chapelle of Paris, or St. Stephen's at Westminster. Yet they were painted, and in this manner; the rubble of the walls was dubbed out to a plain surface; the angle jambs of windows and doors were made of stone, because that was the best and most durable material for the purpose. The whole of the walls were then covered with a coating of gesso (whiting and size) $\frac{1}{8}$ in. thick, which was gradually thinned off as it approached the stone jambs, which were covered with only a thin coating of it, so they did not show as stone. Upon this gesso, the artist painted his subjects with a red outline and shaded them up with black and red and yellow, using white for the high lights. It should be remembered, that these colours were not used pure except in little bits, but were broken up with white and with one another. The seas of diaper we see in modern churches were unknown to the old artist, who, when he did employ diaper, did so only as a background, or to fill up a space unoccupied with anything more important. From remains being continually being brought to light, we may confidently assert, that nearly every church in the thirteenth century was decorated in this manner; they were whitewashed in the reigns of Edward VI. and Elizabeth, and have, in the vast majority of instances, only been brought to light to insure their more speedy destruction from the church restorer. The interior of a modern church, on the contrary, is neatly plastered with plaster 1 in. or $\frac{3}{4}$ in. thick, which stops flush with the stone quoins, which are left uncovered because the architect has been brought up to consider stone as a beautiful material for its own sake; in fact, just the same as an Italian would regard marble. The consequence is that we see every piece of stone a distinct colour from the plaster, and all the lines of the architecture become jagged and uneven. Nothing is probably more amusing, if it were not at the same time sad to read, than the congratulatory tone of the public prints when they notice the opening of a new church. We are told that there is a spacious and commodious chancel, or that the edifice is built in the appropriate form of the cross; that all the capitals have been beautifully carved into roses and lilies, or passion-flowers, by Mr. X., the architectural sculptor; that the roofs are of high pitch, and have been varnished and stained; that two of the columns of the font are of Purbeck, and two of them of Rouge Royal marble; that the stone reredos is inlaid with finely polished marble, and that the chancel has been laid down with Minton's encaustic tiles. Sometimes, indeed, our breath is taken away by our being informed that the chancel is lined with ababaster. Now, these things are not art, they are only prettinesses. They cost a great deal of money, and do not add to the solemnity of the building. How much better would it have been to have got some young artist to have told some Bible story, some event in the life of our Great Example? The picture or pictures might be done in tempora, the most lasting of vehicles where there is no damp. It might be executed in gri-

* Address by Mr. W. Burges, at the Bristol Church Congress.

saille, or in the four colours like the old examples; and surely the lesson taught by our Saviour working at his father's trade, and being obedient to his parents, may in many instances be worth acres of Minton's encaustic tiles, or yards of inlaid work. But remember, in this instance, I presume the aid of a competent artist is employed; and there are many such among the younger ones who would be but too delighted to work for the church instead of painting pictures for the Academy on speculation, which are probably badly hung, and certainly not sold. Such pictures would have good drawing and expression, and such painters would be able to make cartoons which would also have these qualities, and so save us from so much rubbish which is annually placed in our windows. And here I may perhaps be permitted to pay a tribute to my late friend Charles Winston, so well known for his work on stained glass. He differed most decidedly from the school of art to which most of my friends and myself belong. In fact, he considered the Roman architecture as our true *point de depart*; but with all this he was the unceasing and unsparing advocate of boldness in architecture to the exclusion of prettinesses,—such as cusps and finials,—and of good drawing and good colouring in stained glass. From him I learned a very great deal, and many of the opinions I have ventured to put forward on this occasion I first heard from his mouth. Had he been spared longer he would have seen the principles he advocated in general use throughout the architectural arts; as it was, he only lived to see the beginning.

Lastly, the question presents itself as to what we are to do to beautify our churches. The answer appears to me to be in three things. The first is to use them a great deal more. At the present day, private devotion has, to a great degree, superseded public. How far such a result is desirable it does not become me, as a layman, to speculate. A man will naturally care less for a building which he enters only every seventh day, than one in which he says his prayers every day, morning and night. Perhaps if some of our City churches were kept open all day, the chancel being protected by a grille, public devotion might to some degree supersede private, and people might become to take an interest in a place so much frequented, and with which their hopes and fears are so much associated.

The second thing to do is to have a greater love of monumental art. This love of monumental art is of slow growth, and will not arise in one or two years. By monumental art I mean the painting the walls of our rooms instead of hanging pictures upon them; in spending money on objects of daily use, and in making our sculpture part and parcel of our domestic buildings. The great obstacle to such a state of things is our unfortunate law of leasehold; for who will paint walls when he knows that he has them painted eventually for his landlord and not for his descendants?

The third thing required is a better education of the architect. In nine cases out of ten, if the architect can show his client a sketch of the group of sculpture or the painting he wants introduced in connexion with the architecture, his client will let him have it done. But unfortunately when the architect, as is too often the case, cannot do this, he takes refuge in notches, foliage, cuspings, chamfers, tiles, marble inlaying in stone, and other prettinesses which, in the end, cost more money than works of art, and are nothing to look at when they are done. An instance of this obtains in our metal-work. I should very much like to know the sums annually expended on the wretched brasswork held together with screws, that we now see in every church. We do see an immensity of it, but how is it that we so seldom see cast brass work with figures like the Albero of Milan? Simply because it is easier to draw a thing with a pair of compasses than to design historical groups of figures.

It should also be remembered that no artist—and an architect such as we now want is an artist—can possibly do more than a certain number of works of art. All above that must be done by his clerks, while he himself cannot have the time to properly think over even those he retains (if he does retain any) for his own special attention. One great remedy I would propose is a more general distribution of work among architects, and, at the same time, a demand for higher qualifications from them. They should also be paid as artists are paid, according to their merits, and not upon a percentage of work done. I have thus, according to the best of my ability, touched upon the present state of ecclesiastical decoration, and the means for our future improvement. The great thing is to create a demand, by opening our churches every day, and all day long. The decoration will soon follow; and a crop of artist-architects and artist-painters will arise which will be an ornament to our church, and prove in this country that she follows up the proud position she has taken up of late years, viz., as the great patroness of the fine arts. At present the question is simply between art and prettinesses.

THE INSCRIPTIONS AT NEW GRANGE, IRELAND.

We have received a letter from the Rev. James Graves, in which he says:—

"I give you sincere thanks for your courteous reception of the very emphatic denial which I felt constrained to oppose to the statement made, in your editorial capacity, as to the alleged New Grange inscriptions. I wrote strongly, because we Irish archæologists are only just emerging from the odium brought on us by the wild speculations of such writers as Pownall and Vallancey,—speculations the utter baselessness of which made Irish archæology a laughing-stock to the learned.

I knew full well what Pownall and Vallancey had written, and feel quite certain that every thing they saw still remains to be seen. Lines described by the former as of 'sufficient breadth and depth' to permit him to 'lay the nail of his little finger' into them, and which had been exposed to the action of the air, at all events since this mound was opened by the Danish plunderers in the eighth century, could not have become obliterated since Pownall and Vallancey wrote. I cannot, therefore, assent to your theory of the disappearance of the inscriptions. These zealous but injudicious antiquaries saw—what *we* can still see—the circular markings and palm-leaf shaped carvings which cover several of the stones. They mistook these markings for Oghams; (a form of writing, the great antiquity of which, however, has yet to be proved;) set their fertile fancies at work to make out the supposed meaning of them; and succeeded—with a vengeance!

In illustration of the mode of investigation patronised by the Vallancey school of antiquaries, I may be allowed to mention a case in point. The hill of Sliav-Igrine, in the county of Kilkenny, being capped with millstone grit, was a famous place for the manufacture of millstones before the introduction of the French burrs. On the summit of this hill stood, at the commencement of the century, a large mass of breccia supported on smaller stones, and exhibiting a most mysterious inscription on one of its faces. The late William Tighe, esq., of Woodstock, was at that period engaged on his valuable statistical survey of the county. Strongly imbued with the Vallancey theories, he at once set down this stone as a Pagan altar; and, in the plate which illustrates his observations thereon,* he renders the inscription thus:—

nay more, he read and translated it, off hand, as

and then proceeded to speculate on the worship of "Belus" *alias* "Dionusos" by the ancient Irish. This notable inscription, with the speculations thereon, were copied into Gough's edition of Camden's "Britannia," and remained unquestioned, until, by means of information supplied to me by the late profound Irish scholar and historian, John O. Donovan, LL.D., who was a native of the district, I was enabled to prove, in the pages of the "Journal" of the Kilkenny and S.E. of Ireland Archæological Society,† that the origin and meaning of the inscription were both well known to the peasantry of the district. It seems that a millstone-cutter named Edward Conic, had, in some idle hour, *whilst leaning over the stone*, rudely cut, with his pick, his name and the date of the year,

In this way the letters, rudely cut into the rough breccia, and covered by the lichens of some seventy years, assumed to one standing in front an archaic, and, as Mr. Tighe observes, "Pelasgic" character; whilst, to a person leaning over the block and reading them as they were cut, they at once resolved themselves into the above common-place form.

Now for my moral. Is it not quite as possible that some person writing on the supposed introduction into Ireland, by the Phœnicians, of the *cultus* of Belus, might quote this inscription from Gough's "Camden" with as much reliance on its genuineness as you place on Pownall and Vallancey's versions of the alleged inscriptions at New Grange?"

Very likely; but what of that? Tighe being misled does not make Pownall and Vallancey wrong. Moreover, in this case of Tighe's, there *was* an inscription, although it was read upside down; but suppose some one unacquainted with its true nature were to maintain that there was no inscription at all,—only palm-leaves and circles: would he not look quite as ridiculous as Mr. Tighe did, when the truth at last came out?

Of the inscription which Mr. Pownall says he saw he gave an engraved *fac-simile*, copied from a matter-of-fact *impression of it, taken by a surveyor* whom he employed for the purpose; and the form of this inscription is certainly neither that of palm-leaves nor of circles, but a series of alphabetical characters; and, what is more, several characters of a very analogous description to the first and most elaborate of them all have, *since then*, been discovered on the Northumbrian rocks.

Colonel Vallancey states that the *seven* inscriptions which he describes were, generally speaking, in the Ogham character, and comprised all the forms of it; and his account of them is such that no assertion as to palm-leaves and circles can ever explain them away into anything at all like an enthusiast's delusions. Either Colonel Vallancey was a lying and most unconscionable impostor; or there are, or, at least, were, inscriptions in the sorcery-hall at New Grange. It is not his "speculations" at all we have here to do with, but his *veracity* as to matter-of-fact *statements*. As for Governor Pownall, how it was possible that *he* "mistook these markings for *Oghams*," as Mr. Graves states he did, we cannot for the life of us conceive; for Pownall maintained that they were not old Irish of any sort at all, but Phœnician characters. But "give a dog a bad name, and you may hang him at once."

In short, we cannot believe in the palm-leaf and circle theory; and it is our deliberate opinion that Vallancey and Pownall have been *unduly* discredited; and that archæologists who have no anti-Pownall and anti-Vallancey bias or animus, and are fearless of ridicule or odium on that account, but still are doubtful of Pownall and Vallancey truthfulness, ought carefully to retest the actual and positive statements,—not the mere speculations,—of these authorities, as to New Grange; and, with moral courage, publish the result.

Every one knows that authors *have* made statements which have been jeered out of all countenance till they were only remembered by a few who possessed *internal evidence of their verisimilitude*; or till it was discovered, after many years, that the sceptics were wrong, while the original statements were correct.

As to our theory, as Mr. Graves calls it, of the disappearance of the inscriptions;—the possibility of their having scaled off was but one alternative half of that theory; and on this point we may observe that it is rather too much for *our* belief, that, for nine or ten hundred years, a small hole, like the entrance to a loose stone barrow such as New Grange, should have remained clear and unobstructed, or open to the access of air to the interior; and that we do *not* think that the breadth and thickness of the nail of the little finger of Mr. Pownall, which he *laid* into the incisions, could have been much to scale off in not far short of a century. The other, and better half of our theory was, that the inscriptions *may be there still* (apart altogether from palm-leaves and circles), but that they may be only visible in certain circumstances as to light and eyesight. We have ourselves entirely failed to see certain masons' marks on a church wall one day, while, on another, from a different play of light and shade, we could see the marks distinctly. Had it been some one else who had looked, on the first of these occasions, this would have been strong negative evidence against ourselves. And yet the marks *were* there all the same. In like manner, there are rock symbols in Northumberland which can

* Tighe's Survey of Kilkenny, p. 622. Dublin, 1802.
† Vol. I., first series, p. 300.

only be seen at times, like the marks referred to, even by daylight, far less, as at New Grange,—in a dark chamber, and by mere candle light.

MODERN ART IN FLORENCE.

It is pleasing to admit the conviction that in the degree nations progress as to whatever constitutes worthiness of life, so do their arts advance in power and truthfulness; and this idea we have been glad to be confirmed in by the exhibition of painting and sculpture just closed at the Florence Accademia. Not one subject from mythology or ancient history! not one hero of Greek or Roman classicism! not one "Holy Family" or established theme from the legends of saints! but, instead of these, groups from Italy's Mediæval story, illustrations of her poets and romancists, scenes from the lives of her poets and artists themselves, or domestic subjects of every-day life—labourers, shepherds with their flocks, family groups, quiet secluded landscapes, the river side, or the woody glen; above all, invested with stirring interest, episodes from the story of the great events by which Italy has within recent years arisen to so high a development of national life, so near to her long-dreamt-of unity! In this new direction given to the range of her arts, we think may be discerned indications of the progressive tendency in the national mind and institutions,—the emancipation, in brief, from the shackles of the past. Within the last fifteen or twenty years a change has taken place, and new aspects have presented themselves in the art-creations of the country, so striking that we might call it *revolution*, and interpret in it the signs of a future fraught with high promises. The influence of those artists of the present century, Benvenuti, Camuccini, Bezzuoli, once so much esteemed in the Italian schools, and others who may be placed in the same classification, is disappearing; and, allowing to them all the merits their admirers ever claimed, we cannot but think there is cause to rejoice in the return to Truth and Nature, to simplicity and earnestness, beyond what the works of those masters, though effective and brilliant, are generally distinguished by. Landscape, till within this recent period, has been almost totally neglected in Italy; and we understand that, even at this day, the most esteemed figure-painters of Rome are accustomed to employ other hands for filling in such backgrounds of scenery as their compositions require! At Rome, indeed, all that is worst in mannerism, coldness of feeling, academic pedantry, and affectation, have still their stronghold, as if that city were destined to display, in art as in other walks of mental operation, all the results of slavish adherence to tradition, egotism, and narrowness.

The lately-closed Exhibition in Florence was the first got up by a new "Society for the Promotion of the Fine Arts," formed there,—the result, it seems, of schism or contrarieties in the local artistic circles that perhaps may be regretted. Whatever the *morals* of the question, we need only state the declared purpose of this new association to found its procedure on the elective principle, on the annual renewal of offices, and appropriate its funds, in two equal parts, for the purchase of works to be given as prizes, and of other works, among which the winners may make free choice. Already about 400 members have enrolled themselves, and the very moderate price of shares, 2 francs, will naturally be an inducement to many. This exhibition was in a strict sense *national*, comprising works by more than ninety painters, and about twenty sculptors, natives of Florence, Milan, Venice, Naples, Palermo, Genoa, Modena, and other provincial towns. We may notice the most interesting of its contents under their several classifications:—

Subjects from the Lives of Artists and Poets:—"Filippo Zippi declaring his Passion to the Nun,"—Castagnola. A powerful and dramatic picture, telling its story with wonderful force of expression, though the artist takes liberties with the facts of his subject, the frail fair one not having been a nun, but only the pupil of a convent, and Zippi himself a runaway friar, which he does not appear to be in this admirable painting. "Molière reading one of his Comedies to a Servant-maid,"—Gatti. Full of humorous vivacity, the contrast between the two personages well marked, the colouring rich and mellow. "The Friends of Dante,"—Tedesco. A group of youths and maidens playing on instruments and singing, the young poet looking on, apart from the rest, and calmly meditative; a solemn landscape beyond: pleasing and finely imagined, the heads beautiful, but the colouring somewhat cold and gloomy. "Michelangelo, when a Boy, chiselling his Mask of a Satyr:" life-size statue, by Zocchi. Singularly truthful and earnest, an example of the high interest attainable with subjects possessing no attributes of the beautiful; the intense enthusiasm of that youth, seated at his task, is not to be forgotten. "Dante writing:" a half-length statue, by Fratellini. Thoughtful and severely intellectual, appropriating the best traits in the authentic portraits. "Cavour" and "Niccolini," seated statuettes, by Rivalta; both full of individuality: the statesman profoundly wrapt in thought; the poet, in his old age, melancholy and valetudinarian.

Mediæval and Modern Historic Subjects.—"The Corpse of Jacopo de' Pozzi disinterred and dragged out of a Gate of Florence by Boys,"—Borroni. A revolting episode from the tale of the Pozzi conspiracy, but treated with great power, richness, and contrast of colouring, an effective introduction of Mediæval costumes. "The Assassination of Corso Donati,"—Picrotti. A small picture of good composition: monks and attendants are seen carrying the body of the murdered noble to the convent of S. Salvi, near Florence. "The Duel,"—Sarra. A scene from Guarazzi's "Siege of Florence:" the betrayer and defender of Florentine liberties in combat before witnesses; the traitor falls, and is pronouncing his last words; the tragic and chivalrous elements of the subject well brought into relief, though not without something of the theatrical. "King Victor Emmanuel on his way to visit the Baron Ricasoli at his Villa,"—Norfini. The king and his cousin, in an open chariot, outriders, and eager crowd of peasants, the baron meeting them on horseback; a pleasant landscape, and an old mansion on a height beyond. "Last Hours of Col. Bocchi, shot by the Russians at Warsaw,"—Ademollo. An affecting and impressive picture. The ladies of the colonel's family have taken leave of him: a Capuchin and soldiers accompany him as he leaves the prison; the pathos of this scene finely conveyed without the least exaggeration; the colouring mellow and effective: one stands riveted by interest before such a work.

Genre Landscape and Domestic Subjects, &c.—"Venezia Attuale" (Venice at the present day),—Signorini. A little picture full of significance and appealing force: a canal, a Gothic doorway, out of which Austrian soldiers are lounging; grated windows above, from whose bars protrude the hands and arms of prisoners; a murky lurid twilight over the scene. "Political Questions,"—Capucci. An old man and his good wife quarrelling,—we see what about. He wears the Italian tri-colour cockade: she (evidently Neapolitan), is a furious legitimist, and storms while he is laughing: a very well-composed and comically-expressive little picture. "Venetian Mother and her Son, or the Field of S. Martino,"—Ticozzi. More interesting for its subject than its treatment, but not without talent: the young volunteer's figure good. "Return from Fishing,"—Saporiti. A wild sea-coast, a stormy sunset; fishermen dragging their boat to shore, and lighting a fire on the beach. "Labourers towing a Canal-boat,"—Signorini. The light of the setting sun reflected on the brawny figures bending at their task: with truthfulness,—indeed, admirable. "A Flock of Sheep on the high Road, near Pisa,"—Benassai; and "A Shepherd Boy with his Flock,"—Nozaro; both examples of feeling for nature, and the power of making much out of the commonplace that distinguishes genius. "Cattle drinking at a Pool,"—Fontanesi. With a sterile but impressive landscape seen under stormy twilight. "The Lakes of Trasimeno," and "Morning on the Arno," both by Gelati, evidently an earnest student and true lover of nature, his effects of misty brightness and pale gleaming light on hill and water finely brought out. "Margaret returning from Church,"—Induna. A lovely figure, full of placid sweetness, the calm of innocence before passion has been known by the beloved of Faust.

The sculptures in this exhibition were, generally speaking, inferior to the paintings,—some decidedly bad,—the introduction of modern costume, in certain instances, ungainly. A few specimens of wood-carving were praiseworthy. *Apropos* of modern art in this city, we may here mention the large collection formerly in the Crocette Palace (a grand-ducal residence), now in the *Dogona*, occupying an appropriate suite of rooms, and visible on application to a custode. Many later additions made, after the change of Government, to this gallery, are pictures of considerable though unequal merits, illustrating the story of the war in 1859; and it is gratifying to see how much talent has been brought into activity by the high interest attaching to those events; to see Italy's noblest struggle for freedom worthily imprinted on one phase of her artistic produce. Solferino, S. Martino, Montebello, are indeed well illustrated, in most instances with elaborate study of details, and an idealising of realities. In the same gallery we see the masterpieces of Bezzuoli, "The Entrance of Charles VIII. into Florence," a striking and effective picture of its kind; and another great historic work far superior, "The Abdication of the Duke of Athens," by Ussi, that made quite a sensation when first exhibited, about three years ago, and certainly has established a high reputation for an artist, young, we believe, when he completed this elaborate picture.

BERLIN AND MAYENCE.

Berlin.—In the Oranienburg-street, a few doors from the house in which the great Humboldt ended his days, the Jews of this city have just completed a new synagogue, the gilded dome of which is seen to great advantage as you approach from the Northern Railway. The building is Byzantine in style, and the exterior is faced with coloured stone, a treatment entirely novel here, where stucco is the fashion to a most alarming and monotonous extent. The façade is in yellow facing bricks, on a plinth of Silesian granite: bands of reddish-brown brick give variety and life to the larger masses, whilst the arches are turned in Nebra sandstone. Three domes surmount the elevation next street, the centre one 160 ft., the two others 115 ft. high, and all three are richly gilt. On entering through a portal, flanked by columns of polished granite, we reach the "outer court," a rotunda, in the centre of which is a fountain, for the "washing of hands." Next to this is the pronaos, and then comes the temple proper. This is 145 ft. long by 102 ft. wide, and is divided into nave and side aisles by two rows of very elegant cast-iron columns, which carry a series of hemispherical domes, supporting the galleries (for the women), which are reached by staircases branching right and left from the rotunda. The temple, which rises to a height of 85 ft., contains 3,000 sittings, and is now receiving frescoes on its walls, and stained glass throughout. A novel mode of lighting by gas has here been adopted: a space of about a foot has been left between the outer plain glass windows and the inner stained glass: this space has been provided with the necessary ingress of fresh and egress of hot air; and the gas burners are here placed after the manner of transparencies, thus avoiding the glare and heat produced by gas. The light diffused by this means is said to have a magic effect, and might, perhaps, be worthy of imitation. The total expenses, including purchase of site, amount to 75,000*l.*——The Royal Museum of Casts has lately received some very valuable additions. A copy of the celebrated Brunswick Lion, said to have been cast in iron in 1166, has been added; as also a copy of Victory, by Rauch, the original of which is in the White Chamber, at the Palace. Not the least interesting is a series of casts, ordered by a recent commission sent to Athens for that purpose.—— Visitors of the Great London Exhibition of 1862, will remember the beautiful bronze model of Rauch's Frederick the Great.* This was the property of his Majesty, and one of two cast by Tanda, a pupil of Rauch's, and in the presence of the great sculptor. The other copy was, until lately, in possession of the Rauch family: it has now been purchased by the king, and presented to the Emperor of Russia.

Mayence.—The cathedral has for some time been in the hands of Director Veit, under whose directions, and according to whose cartoons the interior is being decorated. The chief artists engaged on this work, are Messrs. Settegast, Lasinsky, & Hermann, and already the chancel and both transepts are finished, whilst the nave is rapidly approaching completion. All architectural members, such as string courses, ribs, and capitals, as also the groined roofs, have been picked out in bright colours, whilst the walls and shafts of columns have been cleaned of the accumulated layers of whitewash, and show a warm

* It was one-tenth real size, and stood about half way down the Foreign Picture Gallery.

yellowish red sandstone. The spandrels under the dome, which rises at the intersection of transepts and nave, have each been decorated with a palm-tree and two angels, whilst the four arches have received frescoes representing the scriptural subjects:—Abraham's Sacrifice, the Agnus Dei, Christ as the Saviour, and John the Baptist. The lady-chapel will have similar colouring; and the wall space, under the clerestory windows of nave, twenty in number, will be filled up with frescoes, illustrating the life of the Saviour, similar to those by Schrandolph in the Dom at Spire.

GLASGOW CATHEDRAL WINDOWS.

We may record that on the 18th instant, at a meeting of the subscribers to the Glasgow windows, the series of windows now completed were formally handed over to the First Commissioner of her Majesty's Works, the Hon. W. Cowper. An address was read by Sir Andrew Orr, and letters by Mr. Heath Wilson; and the Lord Provost, Mr. Cowper, and the Duke of Montrose addressed the meeting.

Mr. Cowper, in the course of a very interesting address, said,—

> This is in many respects a great era in the history of glass-painting. I cannot sufficiently commend the good judgment of the committee in having determined that they would obtain the very best art that was available, wherever they might go to seek it. Some persons may think that it was unpatriotic to prefer foreign art to native art; but a moment's reflection will show that such an idea is entirely without justification. Our object is to get the best art. Now it happens that in our own country artists of skill and great genius were not accustomed to employ themselves in designing painted glass; but in Munich there is a school of painters who have practised themselves in fresco painting, who are also well acquainted with monumental art, and who are in close juxtaposition with a glass manufactory; so that, with them, the making of coloured glass is not, as with us, mainly a manufacture, or reproduction of the windows of a former period, but a work of art—a school of art—a production of very high and great merit. Now, it is much better for the glass artists of our own land that they should have put before them, as has been done in this building, the highest example that can be found of the excellence at which they should aim. It would have been no advantage to them to have put inferior glass here, so that they should not have risen above the level they had reached. It is as natural that we should go to great artists for painted glass as that the Germans should apply to us for great engineers to make their railways and build their bridges. And we might as well say that our national galleries should contain no great Italian or Flemish paintings, as say that a building which we wish to decorate as highly as we can should not be decorated by foreign artists, who live in a foreign country. We have in these windows around us admirable drawing, dramatic effect, great character, great expression, all within the limits that are proper to glass-painting. The glass here is, I see, strictly mosaic glass. There is no attempt to make transparencies or to make pictures such as would be made upon a wall or upon canvas; but we see the skill and the genius of great artists displayed strictly within the rules which make glass-painting a special branch of art. We have the gem-like brilliancy of the colours: some persons think them not sufficiently deep, but I am quite sure that those persons who use this building, and want light in it, must be rejoiced that the light is not obscured, is not intercepted, and that the building is as useful for the purpose of reading as if, instead of coloured, you had white glass in the windows. And I think we have really here a work of very high art,—not merely a glass for ornament and decoration, but a work of art that subserves a higher purpose. Art finds its noblest mission in elevating man's thought, and in giving him vivid and elevated images; and it is specially consecrated, when it adorns,—as it does here,—the House of God, and promotes the edification of those who frequent it.

We have so recently commented on the windows that it is unnecessary to do so now.

HOW THE ARTS ARE ENCOURAGED IN FRANCE.

A few days ago the Emperor and Empress invited to the Imperial table at St. Cloud the laureats of Rome who lately gained the grand prizes for painting, sculpture, architecture, and musical composition,—MM. Maillard, Delaplanche, Deschamps, Guadet, Dutert, and Sieg. Among the other guests were Marshal Vaillant, minister of the Beaux-Arts; Count de Niewerkerke, superintendent of the Beaux-Arts; Count Baciocchi, superintendent-general of theatres; M. Auber, director of the Conservatoire, &c. According to *Galignani*, the Emperor and Empress gave the most gracious encouragement to the young artists; and during the evening her Majesty presented to each of them a photograph of the Emperor, of herself, and of the Prince Imperial, signing each card with her name. M. Sieg was also informed that his cantata, which had gained the grand prize for musical composition, was shortly to be performed at the Grand Opera.

In the course of another century or so, similar things will, perhaps, be done in England.

THE SANITARY STATE OF OUR INDIAN ARMY.

This is a subject, as our readers know, which has for some time engaged our occasional attention in the *Builder*; and it has been gratifying to us to note, now and then, the way in which the subject has of late been taken up both in the newspaper press and in special publications. The most recent work on it that has come under our notice is one by Mr. Stewart Clark, M.R.C.S., inspector-general of prisons, North-west Provinces, India (Smith, Elder, & Co., publishers). In this volume, which is titled "Practical Observations on the Hygiene of the Army in India," the author treats of air and ventilation in barracks and tents, water supply, drainage, barrack and prison construction, &c.; and although he does not seem to be very well read in the history of this movement, and has derived a portion of his information as it were second-hand, and reurges some points as if they had not been urged before; still the volume contains a good *resumé* of what is desirable, and some useful suggestions. We shall therefore endeavour to give our readers some idea of the book.

With regard to the construction of barracks, he remarks that, whether double-storied or not, the ground-floor should be well raised, say 4 ft. above the level of the ground; and it should be borne in mind that the cubic contents of an apartment do not always indicate that the inmates have a sufficient supply of pure air, particularly in a hot climate: there must be a certain amount of superficial area as well, otherwise ventilation will be imperfect. Each inmate of an apartment should have at least an area of 72 superficial feet, and the beds should be at least 4 ft. apart. There can be but one opinion regarding the advantages, in a sanitary point of view, and in regard to economy as well, of the location of troops or other large bodies of men in small parties in separate apartments. Some of the new, double-storied, one-company barracks, lately erected in India, are said to have cost upwards of 170,000 rupees each. Now a very excellent, substantial house, containing four or five good rooms, each room affording ample accommodation for four men, could be erected for 8,000 rupees; six such houses would accommodate a company, including non-commissioned officers; and four more similar houses, on a slightly modified plan, for married men, would make a total of ten houses for each company, at say an average cost of 80,000 rupees, being less than one-half the sum which is said to have been expended on the immense piles of buildings alluded to, which will certainly have their turn of unhealthiness like their predecessors.

The new barracks recently erected have an ample number of openings for the ingress and egress of air, such as doors, windows, open ridges, &c.; still, when they are occupied by the regulation number of men, the air during the night-time is foul and poisonous. It is generally supposed that the air in those barracks is always pure and sweet; but such opinion can only have been gathered from day inspections in the cool weather, when the barracks have been empty during two or three hours. "I consider," remarks the author, "that no barrack, containing the regulation number of inmates, and not possessing other means of ventilation than the usual openings for the ingress and egress of air, is ever, during the hot sultry months of the year, or, perhaps, at any time, free from a poisonous quantity of foul air at night."

Those residents in India who have no better means of procuring fresh air than those afforded by natural channels, pass restless nights, enveloped in foul air and bathed in perspiration, the arrest of which, by the atmospheric changes taking place in the early morning, results in seriously impaired health, and not unfrequently in acute disease, ultimately terminating in death. It is a well-known fact, that the most healthy men in India are those who provide themselves with large, well-ventilated bed-rooms, and sleep invariably with closed doors and windows. The habits of most of the different groups of Europeans in India are not so widely different, with this one exception, as to account for the frightful sickness and mortality confined to one of these groups. Some of them eat the same kind of food, drink the same kind of water, and are, in some instances, not less intemperate; yet they do not suffer in the same degree; but then they have an abundance of fresh air. It then becomes absolutely incumbent on those who have the charge of the suffering group to remedy so palpable an evil without delay.

The author describes means of ventilating barracks and tents. Punkahs, he observes, will to a certain extent set the air in motion, and thereby cool the body through increasing the evaporation of the moisture on its surface; but they do not expel the air from the interior of buildings, nor reduce its temperature in the least degree; and in the case of apartments filled with human beings, allowing about 60 square feet to each individual (which is above the average area per head in most of the old barracks in the North-West Provinces), they simply mix up the air of the apartment; so that, instead of each person breathing the exhalations of his own body, he inhales the general foul air of the barracks. An apparatus for the more thorough ventilation of barracks and tents is described as consisting of underground flues of masonry, with main and branches, and with fan apparatus worked probably by steam or ox-power connected with the main. Each separate department of a barrack, or each tent, is to be fitted up interiorly with pipes and ventilating apparatus, to be supplied with fresh air from the main, in a way which the author illustrates by diagrams.

Very little is said on the subject of drainage; but the author recommends the application of the sewage to the land by vehicles, leaving the drainage for surface water and similar uses alone.

A plentiful supply of pure water for the troops, the author remarks, can very easily be obtained with ordinary care, and at no great additional expense to that attending the present defective system; but the rivers are far too foul to be of any use in supplying such water. In addition to all other kinds of filth the dead are thrown into the rivers, instead of being burnt or interred; and thousands are disposed of in this way annually. The author has himself seen upwards of fifty dead human bodies, besides numbers of carcases of lower animals, floating in the river Hooghly, within sight at one time; and these corpses float up and down with the tide until the flesh falls off the bones, and they sink to the bottom, or lie exposed, at low water, on the muddy banks.

The subsoil of the localities where water is supplied from wells, he thinks, itself pretty well purifies the water from organic defilements. Still, he acknowledges that the well water is but too often very foul and injurious. Drawing the water from the bottom of deep wells, and filtering, are recommended, as well as boring deep for pure water. The well is recommended to be near the ventilating apparatus, so that the same steam-engine would do for driving the fans, pumps, and ice-making machines. Local filters, swimming baths, and also numerous drinking-fountains, supplied from the mains, are included in the author's suggestions.

We are hopeful that much will be done, during the present Governor-Generalship, for the sanitary improvement of the army, as well as of the towns, in India.

DISCOVERY OF A DOLMEN.

A letter from Brittany, published by the *Pays*, says, that while digging recently in a *lande* belonging to the Farm of Rô, some of the peasants laid bare the chief stone of a Dolmen, which, although small, is none the less remarkable from the coarse attempts at sculpture which cover all its sides. In this Dolmen, as in that of Lockmariaker, is found the strange figure, the true meaning of which the learned have not yet been able to discover. The upper part of the stone which covers the monument still bears the impression of the rings destined to hold the victims, and the channel which led their blood into the sacred vessels. The piers which support the top of the edifice are covered with sculptures, which it is difficult, not to say impossible, to define. They resemble an immense serpent, rolled and interlaced, and, in some places also, wedges driven one into another.

These whimsical designs even seem to result as much from the configuration of the stone as from the work of man.

The excavations carried on at the base of the Dolmen have also brought about the discovery of some Celts and two golden medals, bearing on one side the figure of a warrior, with his head covered with a helmet, and on the other these words, placed along the rim, APP.—CEAU.—GAL.; of a few lachrymatory vessels; and of the iron heads of battleaxes, or *framées*, and of *angons*, completely eaten up with rust.

PAROCHIAL SCHOOLS, MILBORNE PORT.

These schools, the foundation-stone of which was laid with due ceremony in May, 1863, were publicly opened in July last by the founder, Sir William Coles Medlycott, bart., after divine service at the parish church, when a sermon was preached by the Ven. Archdeacon Fitzgerald.

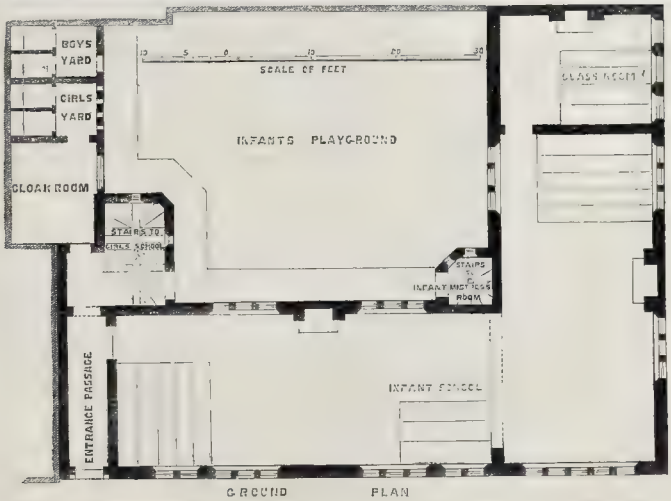
The schools are in the Tudor style, and are built with stone procured on the site, the dressings and bands being of Tisbury stone. A spacious piece of ground near the schools is reserved for the use of the children.

The plans were supplied by, and the buildings completed under the superintendence of, Mr. Henry Hall, of Duke-street, Adelphi. The works have been carried out by Mr. Alfred Reynolds, builder, of Milborne Port.

PUBLIC ART-EDUCATION.

The prizes awarded to the students of the Government School of Art, Liverpool Institute, were presented last week; Mr. Beresford Hope presiding. In the course of his address, after speaking of the alterations he thought necessary in schools of art, Mr. Hope said he would then consider why the people of Liverpool should support a school of art. Other places which had schools of art were seats of manufacture, and required instruction as to the design of the works which they produced. But Liverpool derived its wealth from commerce with the ends of the world: its merchant princes brought their treasures from the utmost bounds of the ocean; why should they have a school of art? Liverpool was not art productive, but it was art consuming, and the consumer of art was as much in need of art education as the producer of art. As civilized human beings they were wearers of clothing and users of furniture, and were thus consumers of good or bad art, and therefore art-education was necessary to them. This might not be one of those great truths which were written on the broad face of the heavens, but it was not the less true. The feeling of the beautiful, and the feeling of the well-proportioned and the beautiful, were at the base of religion and morality. He here took up a position which, he believed, had never been taken before, and he felt convinced of the truth of it, because he felt this was a point we were working to. He trusted that a classical education would always be given in our public seminaries, because it brought men into direct contact with those countries in which, by the inscrutable and wonderful disposition of Providence, a great revelation of ideas of beauty in art and literature had been made three and two thousand years ago,—the lands of Greece and Rome. But all could not have a classical education; and what was a substitute for it? What was there that could bring the great masses of our people face to face with the great productions in art of Greece and Rome? He said distinctly, art-education, and the studying, the exhibition, and the copying of the great works of art of that time. All must admit that to fully appreciate a work of art, unless they were looking at it with a well-educated mind, it was necessary to copy it. The shrewdest of the Romans,—old Horace,—said, "The mind is more lazily stirred up by what goes in at the ears than what is stuck up before the faithful eyes." And here, he said, he must bring a charge against South Kensington; and having observed that he had spoken in praise of the art of ancient Greece and Rome, but not more warmly than it deserved, proceeded to speak in enthusiastic terms of Gothic art, noticing by the way its manifestation in the writings of Shakspeare and Tennyson. He said Gothic art should be held in equal honour with the art of Greece and Rome, and that it was a disgrace to this country that the former was not taught as generally as the latter. The revival of the art of Greece and Rome in Italy in the sixteenth century was beautiful and graceful, but still artificial and local. They were bound to claim that the instruction which was supplied from South Kensington, should not be so exclusively Classical, so exclusively *Renaissance*, as it hitherto had been; but that a greater recognition of Gothic art should be made by the South Kensington authorities. A little more nationality, a little more wideness in specimens, with not so much worship of the narrow school of Italian *Renaissance*, would work, he thought, very healthy and very agreeable reforms.

GIRLS' AND INFANTS' SCHOOLS, SAINT GEORGE-THE-MARTYR, QUEEN-SQUARE.



This building has been erected in Gloucester-street, Queen-square, as the Infants' and Girls' Schools of the Parish of St. George-the-Martyr. It contains on the ground floor an infants' school, with class-room to accommodate 200; and on the upper floor a girls' school, with class-room of the same size as that below. A mezzanine floor contains two separate residences for the mistresses, each consisting of living-room and kitchen, scullery, pantry, and three bed-rooms. It has been designed and carried out under the superintendence of Mr. S. S. Teulon. Messrs. Patman & Fotheringham were the contractors. The total cost of the building was 2,800*l*.

Public Hall for Leyton and Walthamstow. It has been resolved to erect a building for "meetings for the promotion of the social, literary, and moral improvement of the inhabitants;" and also, that a company with a capital of 1,000*l*., to be raised in shares of 5*l*. each, should be formed to carry out the project.

SCHOOLS FOR THE PARISH OF ST. GEORGE-THE-MARTYR, QUEEN SQUARE.

MR. S. S. TEULON, ARCHITECT.

GROUND PLAN

SCHOOLS OF ART AND THE GOVERNMENT.

At the York Social Science meeting, in the Education department, Mr. J. C. Swallow, master of the York School of Art, read a paper on "The Relation of Schools of Art to the Government." After tracing the cause of the failure of the first schools, the establishment of the Department of Science and Art, the new minutes, and the recent Government inquiry, he said the report of the select committee showed they had not been able to grasp the greatness of the subject, and, by recognising only the artisan classes, would be likely to produce the same failure as had occurred with the first schools. He thought the art-question wanted taking out of its present narrow limits, and that the education should be more extended, so as to embrace all classes, the gentleman as well as the artisan. The throwing open the schools to all classes had been a benefit to the artisan class, as evidenced by the increased employment of art-students by manufacturers: that was the aim of the Government: let it be proceeded with: others besides that class required education. He thought the provincial school had been starved in order to benefit South Kensington Museum. Schools of art had not paid, and in all probability never would; therefore, it was the duty of the State to contribute to their maintenance. That was already provided by the Government, who this year voted upwards of 90,000*l.* for the purpose. The associated masters have a full belief that only about 10,000*l.* per annum reach the London district and provincial schools. The combined association of masters and committees were about to ask Parliament for a direct grant of 20,000*l.* It was of the partial manner in which the grant had hitherto been distributed that the provincial schools of art complain. He thought that the plan of art-education should be made a grand one; to teach elementary art in every school; a more extended system for grammar and all middle-class schools; a professorship of art at the large colleges; a visiting artist at all the public galleries where students are admitted to copy; that the provincial schools should be schools of painting, sculpture, and ornament, with picture galleries and museums attached to them, and to make the staff of teachers thoroughly efficient. Then there would be no need of a training school for masters, but a central board of examiners only, the same in constitution as the College of Surgeons, who grant diplomas; and there should be travelling lectureships. To the carrying out of such a system three things would be necessary,—local subscriptions, a liberal scale of fees, and a liberal assistance from the Government: then this art question would be in a fair way of solution, and such a development of national taste in art be produced as would raise this country to the highest pinnacle of artistic fame.

THE IRON RAILWAY BRIDGE AT CHARING-CROSS.

In a paper on the Road Bridges of the Charing-cross Railway read before the Society of Engineers, Mr. M. Parkes gives some particulars of the wrought-iron bridge by which the line, on leaving the Charing-cross station, crosses the Thames. It is a bridge of nine spans, six of them 154 ft., and the remaining three 100 ft. Commencing at the north end, the supporting works are as follow:—

North abutment of brickwork, with stone beds for girders: first pier consists of nine cast-iron cylinders, 10 ft. diameter at bottom, diminishing to 8 ft. and 6 ft. diameter in the case of the two outside and seven inside cylinders respectively. These cylinders are merely filled with concrete up to 5 ft. above Thames high water-mark, the lower edge of cylinders being about 6 ft. in the London clay, and are surmounted by a cast-iron bed plate, 18 in. deep. Second pier: this is similar to the preceding, excepting that there are only five inside cylinders: third pier, north tower of suspension bridge altered: fourth, fifth, and sixth piers each consist of two cast-iron cylinders, 14 ft. diameter at bottom, reduced by a diminishing ring to 10 ft. diameter at low water, the lower edge of the cylinders being from 15 ft. to 20 ft. in the London clay. The cylinders are filled with concrete up to 9 ft. below low water, the remainder being brickwork, finally surmounted by granite blocks, 2 ft. 6 in. deep, in semicircles. Seventh pier: south tower of suspension bridge altered: eighth pier, the same as fourth, fifth, and sixth: south abutment, of brickwork, with stone quoins and cornice, bed-stones for girders of granite 2 ft. 6 in. deep.

The bridge is 46 ft. 4 in. wide in the clear, from the south abutment of the third pier; it then widens out, till, at the north abutment, it is 164 ft. wide. The six 154 ft. spans constitute the "parallel section" of the bridge, and the three 100 ft. the "fan section." Each of the 154 ft. spans consists mainly of two trusses 11 ft. 6 in. deep, centre to centre of pins, and each weighing 190 tons; and of fifteen lattice cross girders, 4 ft. deep at centre, and each weighing 8¼ tons. Each of the 100 ft. spans consists of two light trusses, so as to preserve a uniform sky-line, and ten, seventeen, or twenty-four girders 5 ft. deep, according to the position of the span. The weight of the trusses is 40 tons each; and of each of the 5 ft. girders, 27 tons. This section of the bridge is covered over with 6-in. planking. There is a footpath on each side of the bridge, which is carried on lattice cantilevers, riveted to the cross girders on 154 ft. spans and to the cross girders connecting the exterior shallow girders with light trusses in the 100 ft. spans. This bridge has four lines of way between the southern abutment and third pier.

AN EXHIBITION OF THE WORKS OF LOCAL ARTISTS IN BIRMINGHAM.

We have already mentioned that it is intended to open in Birmingham an exhibition of the works of artists who have been born or have studied in this great centre of industry. With care and good management, a collection of this kind will be not only very interesting, but useful. In many instances such assemblages of paintings, works in sculpture, architectural designs, engravings, and other matters which may be fairly brought under the title of the "Fine Arts," would cause surprise to those who have lived for years in particular localities. It is often the case that we have reason to acknowledge the truth of the remark that the prophet is but little honoured in his own country; and it may also be said that, in many instances, persons who have arrived at eminence in the metropolis and elsewhere, do not show that degree of regard which they might be expected to feel for the place in which they have been reared. Bristol, Newcastle-on-Tyne, York, Birmingham, and many other places, are noted as nurseries of artists. Birmingham is especially to be well spoken of in connexion with the modern school of English line-engraving. This department should be carefully represented, and in other ways a goodly show could be made there. In the metropolis and throughout the provinces there is an increased desire for class and local exhibitions; and, during the ensuing year, we look to hear of the attempt being made to open industrial exhibitions in all the important towns of Great Britain and Ireland. Local art exhibitions should, however, be thought of independently of these. In some instances there will be found in connexion with towns a lack of sufficient materials of an artistic description. In these cases the county might be referred to for the purpose of providing materials sufficient for the opening of an exhibition. If this matter were properly brought to the notice of living artists, it would meet with support from them; and we can fancy in connexion with those exhibitions pleasant gatherings of artists who have been long absent from their fellow townsmen.

Notwithstanding the improvement of the national taste in matters connected with art and art manufacture up to the present time, in many large, populous, and important towns there have been no exhibitions of pictures by either ancient or modern masters; and in consequence an important means of instruction and much pleasure are lost. In most instances either the town-hall, council-room, or some other room, might be had for this purpose, at little or no cost, and mostly a small sum charged for admission would defray the expenses. To the dwellers in London, where there are the National Gallery, the Kensington Museum, the annual exhibitions of the Royal Academy and Societies of Artists, and other collections of art-works which are easily accessible, the value of local exhibitions is too little thought of.

The teaching of true art is of wonderful effect, and many who are now famous will remember their first introduction to a fine work by Rubens, Vandyck, Titian, or Turner. All the feelings and instincts for art may exist, and there may also be a true and refined appreciation of the beauties of nature; but in a picture or piece of sculpture of a high class there is shown the machinery by which the artist can express his idea, and give upon the canvass and to the shapeless mass of stone the images of waving trees, the mountain plains and lakes, the storms and calms which are to be met with in nature, or are shown in the human passions.

In many of the wealthy homes of England there are rare means not only of teaching in art but also of improving the taste of the multitude who reside in rural quarters. In many cases those houses are closed, and the rare treasures hidden from the view. In certain instances they are made a show of to those who can afford to pay large fees to the servants who are left in charge. It would be well, however, if, during the absence of the owner those places were left open on certain days for the inspection of neighbours who are in poor and in better circumstances. The clergymen, medical attendants, schoolmasters, old-established tradesmen, and others resident in neighbourhoods might have the power of distributing tickets of admission on the appointed occasions.

This plan is to a certain extent carried out in some places, and we know of no more pleasant sights than groups of school children and rustics wandering with seeming wonder amongst the works of genius which have been collected by the taste and munificence of past generations.

THE PROPOSED REBUILDING OF DULWICH COLLEGE.

At a special meeting of Camberwell vestry Mr. Gull inquired of the governors of Dulwich College, "if any and what steps have been taken respecting the building of a new college since the receipt of the reply of the Charity Commissioners respecting the proposal made by the governors for erecting a college, a portion of which their architect had estimated would cost upwards of 65,000*l.*" Mr. Pew stated that nothing had been done as yet, as the governors were waiting for an interview with the Charity Commissioners. The expenditure of so large a sum as 65,000*l.* was strongly deprecated, and the vestry agreed to a motion by Mr. Gull, to the effect that they were of opinion "that in the future consideration of any architectural plan for new buildings connected with Dulwich College, such plan should be submitted to public competition, and that it is to be regretted that the governors of Dulwich College have departed from this course now recognized by every public body in the kingdom; and this vestry considers that, in order to obtain the most suitable plan with the best economical results, Messrs. Pew & Waterlow should be requested to exert themselves to secure public competition, and to advertise publicly in every case."

WATER SUPPLY.

There has been a considerable stir throughout the country of late as to improved water supply, stimulated, doubtless, by the extreme dryness of the season, which must have brought the capabilities of many towns in the way of water-supply to the test.

Plymouth aims at an improvement of water supply, at a cost not exceeding 20,000*l.*; and a deputation of two members of the Local Board of Health and the borough surveyor have visited several towns, to note their doings and progress in better supplies of water, and have presented their report to the town council. The rules and regulations adopted in Nottingham and Norwich are those they most highly recommend as applicable to Plymouth. Constant supply, with high pressure, is one object in view, and the economizing of the waste by proper arrangements. The constant supply, it was remarked in the report, would doubtless tend to the development of many branches of manufacture in the town in which water forms an essential (as in the use of hydraulic power on Sir William Armstrong's principle, for example, we may remark). The council adopted the committee's report.

West Cowes is moving in the matter of improved water supply. The local board of health have resolved that a further supply is requisite, and plans are before them for the formation of a reservoir and pipes, at a cost of 2,500*l.*

t Morley a deputation has been sent by the abitants of the town, and of Gildersome, ghlington, and Adwalton, to the Bradford poration, in order to ascertain if arrange- nts can be made with them for a supply of ter. Women, it seems, have to go literally es for water for domestic purposes, and after have to beg for it.

PAWNBROKING.

From time to time acts of great injustice to poor are brought before the notice of the blic. As an instance, it is well known that profits of pawnbrokers are enormous. In es of trouble and difficulty, thousands of the dustrious and other classes are obliged to dge the most valuable of their goods, and yet re is no legal protection for these goods in es of fire, bankruptcy, or other mishaps. A wnbroker of Poplar appeared at the Thames fice Court, having been summoned by two men who had left articles with the pawn- oker. The tradesman was well defended by gal help. In this case it came out that if wnbrokers lend 1,000*l.* upon goods they can sure upon that sum and no more: there is no fe taken of the property of the people who ve dealings with the pawnbroker. In this in- nce, a fire had taken place. One of the men applied in connexion with a watch, orth, she said, 5*l.*, but which was pledged for 15s. This watch was partly consumed, toge- er with about 300 others. Not a fraction of e extra value of the goods destroyed came to e hands of those who had pledged them, even offering the legal amount of interest. The wnbroker had the value of the pledges from e insurance office. In this business the law various ways needs amendment.

ARCHITECTS' PUPILS.

Sir,—Will you kindly afford me space in your lumns for a few words about the treatment of chitects' pupils. What do architects take pils into their offices for? Is it to obtain a rvant who will do the work of errand-boy and aughtsman, for three, four, and sometimes five ars, for nothing? Or is it really their inten- on to teach them to be architects?

I am a pupil, and have nearly finished my rticles. When I entered them, I was given to derstand that, with ordinary application, I ould at the close be educated as an architect. wards attaining this object I have been kept, rring five years, drawing eight hours a day or in our office *all* the work is done by pupils) ne or three designs, with very slight alterations, er and over again; and, as is put sometimes your advertisements, am fully qualified to ake perspective views, working and detail awings, &c., of these two or three designs. ut is this being educated for an architect? here is my knowledge of mathematics, me- anics, acoustics, chemistry, shoring, materials, e history of architecture, &c.? Ought I not have had some time allowed me for these udies, as necessary to an architect as they are teresting? It will perhaps be said that I ght to have done this in the evening. Let me one who has been kept eight hours a day ooping over a drawing-board, with very rarely e slightest exercise in the day-time, try, when gets home in the evening, to study if he can. e cannot do it; or, if he can, he does so at the pense of health and life itself. Fresh air and ercise are acknowledged to be as necessary as od; and if we cannot have them in the day- me we must in the evening, and then where is ir time for study? But, supposing I made up ty mind to forego exercise and study in the evenings, ought I not to have had books put into my hand, or recommended to me, on archi- tectural subjects; but in our office this is never ought of; and the volumes of the *Builder*, and few other architectural books, in the prin- pal's office, are very often locked up, so that ne pupils cannot get access to them. In short, ll the benefit a pupil generally obtains from his rticles is simply a knowledge of mechanical awing. And what adequate return is this which might be learnt in a few months) for veral years of the best part of a man's life, and often a premium of 300 or 400 guineas? and how can masters say that they perform eir duty of teaching their pupils the business ind profession of an architect? A. P.

THE NATIONAL GUINEA SUBSCRIPTION FOR COMPLETING THE DECORATIONS OF ST. PAUL'S CATHEDRAL.

The completion of the decorations of St. Paul's is a matter of such national importance (whether regarded religiously or esthetically), that I again venture to trespass upon your kindness, and solicit public attention to the subject. Far be it from me to charge with apathy, lukewarmness, or neglect, the influential personages who have undertaken the collection of funds. I believe they have conscientiously exerted themselves, and done their best to forward the grand work set before them. I further believe they are both surprised and disappointed at the feeble respond that has been made to their call, and are at a loss to account for positive failure, when complete success might reasonably have been anticipated.

By the published return it appears that only 921 individuals throughout this vast capital and great kingdom, at a period of unheard-of national prosperity (as proved by the astounding increase in the value of our exports, and the not less satisfactory returns of the public revenue), have as yet felt disposed to assist the dean and chapter of St. Paul's Cathedral, in their laudable endeavour to render the metropolitan church worthy of the capital, and that true Reformed Faith of which we are so justly proud.

For years past the bald and naked appearance of the interior of St. Paul's has been unsparingly commented upon by every class of foreigners, Protestants as well as Roman Catholics; and now that the dean and chapter *are* exerting themselves to the utmost to remove this too-well-merited stigma upon our church and city, *the needed funds are not forthcoming.*

Magnificent decorations and splendid subscriptions have been raised to restore Canterbury, York, Durham, Ely, Worcester, Chichester, Ripon, Manchester, Hereford, and St. David's. How is it, then, that London, with its immense population, princely merchants, and wealthy corporate bodies, withholds its contributions from an undertaking so deserving of support and commendation?

After the assurance of the dean and chapter that there are unfortunately no capitular funds available for this noble purpose, an assurance confirmed by the Bishop of London himself, there can scarcely be any persons so mistaken as to imagine that there are revenues belonging to the cathedral which might be applied to this object.

The only remaining inference that can be arrived at is, that, with the exception of the *Builder*, the press as a body has not afforded that aid which might have been hoped for, but which you have so handsomely rendered. I trust, however, that this ground for complaint, through your instrumentality and example, will be speedily removed, and that the ready pens of able writers will soon plead the cause and set forth the claim of our national cathedral to public favour far more efficaciously than I have done. Ecclesiasticus.

PAVING STONES RAISED FROM THEIR BEDS BY FUNGI.

An individual circumstance has just occurred in Islington that considerably exceeds the account given by Dr. Carpenter of the paving stones of Basingstoke being rendered uneven, and raised from their beds, by fungi, and necessitating the entire repaving of the town. The largest stone there displaced weighed 85 lb., was nearly 2 ft. square, and was raised 1½ in. from the level of others; but on the 12th of the present month a large paving stone, weighing more than 200 lb., and measuring 4 ft. 1 in. by 2 ft. 1 in., was bodily raised from its setting in the front of the shop of Mr. Frederick Holmes, a hair-dresser, of Goswell-road. A fortnight previously the stone was noticed to be loose, and during the two weeks it was gradually more and more displaced, till it became unsafe for foot-passengers. As the stone was raised by this time 2 in. or more above the level of the others, the authorities were applied to, to reset the stone, and the fungus was discovered growing beneath. When the weight of the stone and the power of resistance of the mortar are considered, the strength necessary to displace the stone does seem most extraordinary. It does not appear to be a very unusual occurrence, as many people have had some opportunity of seeing stones displaced in this manner, and an instance was some time since noticed by the writer of this note, where a large stone in a kitchen floor was completely raised from its setting by a similar fungus. It is not improbable that rotten sawdust is the matrix from which these things spring, as sawdust and shavings are often mixed up with rubbish by builders as a foundation for paving. Decayed sawdust, or any kind of rotten wood, is most fertile in the production of these pests, and should never be mixed up with brick rubbish for foundations, &c.

The particular species just referred to belonged to the mushroom-like fungi (*Agaricini*), and occupied the greater part of the under-surface of the stone. The growth was very abnormal, as from its original place of growth an immense mass of spawn, or *mycelium*, was produced. From this grew a large white, fleshy, shapeless mass, on the edges of which, and sometimes on the surface, were developed various spurious mushroom-like heads, with the gills and fructifying surfaces quite perfect; so that, had the fungus not been taken out in time, it would have been as likely to displace as large a number of stones in that neighbourhood as did the fungi at Basingstoke described by Dr. Carpenter.

W. G. S.

HOGARTH.

Had Charles Lamb, the gentle Elia, and enthusiastic admirer and expounder of Hogarth, been living on the day on which I date this note, he would not have passed it over without solemn recognition, as being the hundredth anniversary of Hogarth's death—the death of him who makes a decided epoch in the annals of English painting. True, he founded no school: without predecessors, he was also without followers, and still stands alone as the great graphic dramatist, without rival, and without imitator. Rather strange, surely it is, that just when it is now the fashion to offer testimonials and stick up memorials to so many men of doubtful, mushroom celebrity, Hogarth should not have been singled out on the present occasion as a foremost worthy of English art. Art-Lover.

October 26th, 1864.

"SHOP SHUTTERS."

In reply to a correspondent on this subject in our last, we have received half a dozen or more letters from manufacturers of shutters, and have forwarded them to the inquirer. As matter of general interest, Messrs. Clark & Co. say the description of shutters he refers to were in use some years since at Messrs. Hatchard's, Piccadilly, but from frequent derangement removal became necessary. They believe, also, such shutters are going out of use in Paris. Messrs. Bunnett & Co. do not speak much better of them, and say, a model may be seen at their works.

ROOFING AND SLATING.

On perusing a recent article in your journal, under the head of "Slating," it occurred to me that it might be instructive, as well as interesting, to many of your readers, to correct what I think an error which your correspondent, as well as many others, are led into by *slating with battens at all*, or with the long almost exploded system of wooden pegs, "with the view to obtain economy," or by using bad nails,—the best being a compound of zinc and copper, or galvanized iron, that will stand driving without bending or breaking short. But to the point of real economy and durability of slated roofs: I have found, during a period of nearly half a century, that by the construction of roofs without any rafters at all, and boarding with 1 in. or ¾ in. with rebated joints secured to fillets on hips and ridges, and well nailed to purlines, not more than 3 ft. apart, less timber, nails, and labour produce a stronger, lighter, and more weather-tight roof, with better and more uniform bed for the slate; and if cracked, loose, or any way defective, this allows the leakage to steal down into the gutter, in lieu of dropping through on to the lath and plaster ceilings. This mode also affords a more easy and substantial mode of repair, and defies the evil to which battens are so generally subject of breaking by the slater's weight when a cross-grain or knot may exist. As a practical superintendent of works, I have devoted much attention to this subject, and as far back as 1840 I registered an improvement on Taaffe's patent

slating, which not only did away with all rafters, but by vertical boarding, with spaced gutters to each vertical joint of the slate, an especially constructed diamond stud-plate, the imperial slate, 2 ft. 6 in. long by 1 ft. 8 in. high, ¼ in. thick, was not only secured at all four angles of each slate, but allowed any single slate, at the shortest possible notice, to be taken out and reinstated, without disturbing the others. Upon this principle, about twenty-four years since, I covered the roof of one her Majesty's large store-houses at Woolwich Dockyard, and which, I have been informed, has never since required a slate to be replaced, and cost, with rafters, 50s. per square: inch board and zinc gutters under the vertical joints of slates cost no more.

H. H. Russell.

N.B.—A rafter 4 in. by 3 in. is equal to a board 12 in. wide and 1 in. thick; and if rafters are set 12 in. apart, they cover the same space, and require no lath battens or spike-nails for rafters.

FIRE-PROOF CONSTRUCTION OF DWELLINGS.

THE DENNETT ARCH.

Sir,—Will you kindly allow us to point out what we consider to be a few errors in the summary of the various thicknesses and cost of fire-proof floors as given by Mr. Eyton, and quoted in your issue of October 15th, viz.;—Brick arches are quoted thus:—

	£	s.	d.
Brick arch 4½ in. thick, iron girders, use of centering and levelled up for tiles, per square	4	15	0
Same if boarded, and the underside levelled and lath plastered: extra cost per square...	2	5	0
	£7	0	0

The Dennett arch as quoted:—

Dennett arch per square	£3	10	0
Extra if boarded, and the underside levelled and plastered	4	0	0
	£7	10	0

You will at once see by these figures that the amount for boarded floor and plaster ceiling for the Dennett arch is 1*l.* 15*s.* per square more than for the brick arch, which in reality wants to be the same in one case as the other, for the one would not cost one farthing more than the other; so the Dennett arch really ought to stand thus in the summary:—

Dennett arch	£3	10	0
If board floor, and the underside levelled and plastered	2	5	0
	£5	15	0

Fox & Barrett's system is quoted, with a cement surface, to be in depth 9 in., and with board surface 11 in.; whereas the sketches in their printed prospectus show that floors having cement surfaces are 11 in. deep, and for floors having boarded surface 13 in. deep, making a difference of 2 in. in height only between their system and the Dennett arch, and not 4 in., as shown in summary.

The insertion of the above facts, which appear at first sight to be of little consequence, are of the greatest importance to our system. And we may also add that one of the main advantages possessed by our construction over any other system is left out altogether, viz., the adaptation of our process to groins, circles, and domes, to any width or height.

A. & R. Dennett & Co.

COMPETITIONS.

Parr (*Lancashire*).—The competition of designs for rebuilding the Church of St. Peter, at Parr, near St. Helen's, Lancashire, has resulted in the choice of those submitted by Mr. J. Medland Taylor, of Manchester. The church will consist of a nave of six bays, north and south aisles, south transept of two bays in width, and chancel, with chancel aisles, which are screened off for organ-chamber and sacristy. There is an engaged tower, capped with an octagonal broached spire at the west end of the south aisle. Arrangements have been made for beginning the church immediately.

New Cemetery, Burton.—Twenty-seven designs were submitted, of which the designs selected by the Board for the first and second premium are those bearing the mottoes (first), "Trent," by Messrs. Lucy & Littler, Liverpool; (second), "The Life Everlasting," by Mr. William Smith, of Adelphi-chambers, London. Two others were mentioned by the committee in conjunction with these, viz., "Labour" and "Hope."

COMPETITION DESIGNS.

DARTMOUTH IMPROVEMENT.

Sir,—It is now nearly three years since the town-council of Dartmouth offered premiums for designs hereon.

Having incurred the usual expense and trouble in acquiring the necessary knowledge of the locality, I prepared a scheme, to which, however, no prize was adjudged.

Subsequently a proposal was made to me to dispose of my designs to a private individual, and I therefore put upon them the low estimate of *ten guineas*—an amount less than my expenses in the matter—to which offer no reply was, however, made.

During the two years and a half which have elapsed since then, I have made sundry efforts to recover my designs, by application to the town-clerk, and personal intervention of friends, but, up to this date, entirely in vain.

This is another example of the scurvy treatment which is experienced by members of an enlightened profession, when, yielding to the seductive offers of public bodies, they offer up their time, abilities, and cash a sacrifice at the shrine of competition. Is there no remedy for such treatment of An Unsuccessful Competitor?

CISTERNS AND DRAINS.

I was called to see a gentleman this morning who was suffering from ill-health. His idea was that it arose from the water he drank, as he was better when away from home. The thought occurred to me that it was possible, as the standing water or overflow pipe in the cistern was connected with the trap, and, of course, leading into the cistern, this was the cause of his being unwell.

I have been in the plumbing trade for some years, and I have often seen the inside of the top of a cistern quite discoloured by the effluvium arising out of the pipe; indeed, when taking off a cistern top that has been fitted very tight, the smell has been very bad, and I have seen a scum on the surface of the water. Now, I believe, in London, the waste or overflow pipes, in nine cases out of ten, are put in in this way, leading from the trap or drain into the cistern, so that the effluvium is confined in the cistern, and so impregnates the water, and causes ill-health to weak constitutions.

This might be easily remedied. Thus, instead of having the waste-pipe standing upright in the cistern, let it be made in the shape of a syphon, or S trap, and, by regulating the ball-tap so that when the water is on from the main it should just flow over and fill the trap made in the waste pipe, so that it may be always full, it would then be an impossibility for any effluvium to arise, thus keeping the water pure. J. Cutler.

SURVEYORS AND TOWN COUNCILS.

I am glad to find that the reprehensible conduct of some town councils and highway boards has been taken notice of in your columns. Unfortunately, "Civil Engineer" has omitted a most glaring case, advertised in the *Builder* of October 8, 1864, and which occupies exactly the space above the Lavenham advertisement referred to by "Civil Engineer." Hear it, ye sages!—

The Rochester Highway Board require the services of an "assistant surveyor." A practical knowledge of his profession (?) indispensable; and the salary, including travelling and other expenses, to be 60*l.* per annum; and should he be a good boy, and his *whole time* be occupied, it would be raised to 75*l.* Is it not disgraceful?

But, bad as you are in England, we are even worse here; for I am now informed that a very intelligent Board *have been led* to order the appointment of a building surveyor at a salary of 52*l.* per annum. How can these men think they are discharging a public duty in making such an appointment, when they must know that the commonest carpenter is now getting 28*s.* per week, and that, if they get a man to undertake the duties, they will lose twice his salary in attending to him to teach him and keep him right? But what description of man will take the appointment? An Assoc. I.C.E., Ireland.

THE CONDITION OF WORCESTER.

Sir,—The sub-editor of our leading local journal must, I fear, have been in a state bordering on apoplexy, when he penned his somewhat vituperative reply to the good-humoured jog administered by "A Lover of Progress." He is, therefore, a sorry champion for the faithful city. "The series of statements" are right in spirit, and, comparatively speaking, give a faithful description of architecture in Vigornia. Compared with other places of its size, the *present state* of our city certainly is not satisfactory, and for ten years the building trade has not been so dull. Scores of building operatives have left, and are still leaving.

Mr. Nonke appears to me to have quite wandered from the subject, and his strong language is altogether uncalled for as well as hot-headed. His declaration, that he knows "of no city in England so enterprising, so lively, and so flourishing," goes to prove that he is *no* traveller: and if he object that "A Lover of Progress's" statement is spiced with what he unflinchingly calls "untruths," how, I ask, can he sit coolly down and say that "streets and squares are now so generally in erection," when a square has not been planned in our city for fifteen or twenty years, and when there are only two squares in the place? New *streets have* appeared but dreamily, and none are *now* appearing. The Arboretum was sold by auction in one lot last June; the public baths that one is in the habit of finding in other large towns grace not our charmingly situated city; and all of us know that our theatre is no credit to us, and that the whole of the twenty boats at the grand stand might be procured any minute, though the last summer has seen the river more patronized than any other summer ever did.

We have, it is true, a plethora of institutes, but they are more like class clubs than the mechanics' institutions of other towns. Sir John Pakington has more than once reminded us of our want of unity in this respect, and unity is kindred to enterprise, therefore, had there existed as much of these ingredients in dear old Vigornia as in other places, we should not have been so much outrivalled by Birmingham. Our champion will not benefit us much by telling us to shut our eyes to the truth, as goodnaturedly told by your correspondent, "A Lover of Progress." An Inhabitant.

GLAZING.

After considerable experience I am inclined to believe that the best material for fixing glass in stone windows is a mixture of Bath stone dust and linseed oil, made up similarly to putty. Its elasticity will allow of any slight settlement if the work be new, and it is more of a waterproof cement than Portland, as it is not nearly so liable to crack. Portland cement without a large proportion of sand, will almost invariably burst glass or stone after a few months; and another objection is, that it stains freestone (Corsham Down more especially), giving it the appearance of having been burnt.

S. B. B.

In reply to "W. B.," on Glazing, I beg leave to say, that I took out some iron casements, and put in large squares of glass instead, with good Portland cement, and the result was, that after a few weeks, and in some cases longer time, the glass cracked, and portions of the stone mullions fell off; upon which I cut out the cement and filled up the space with hair mortar and plaster of Paris, and a second coat of mason's stone dust and plaster of Paris to finish with; and it has never since moved, some having been done more than two years. J. N.

FROM IRELAND.

Pleasant State of the Liffey.—Don't be surprised, says the Dublin correspondent of the *Star*, if you should be informed, one of those days, by super-special telegram, that this, "the second city of the empire," has been decimated by a plague! The hitherto crystal and limpid waters of the "beautiful Anna" river, Saxonly called the River Liffey, has become positively pestilential. Its waters do not now run fresh, crispy, and pure; but black, thick, and frowsy; they lazily drag the putrescence of the city through the broad and deep channel which, at one time, was considered the bed of the river; but what is now in reality the main city sewer!

Increase of Fever in Downpatrick.—The number of cases in the County Fever Hospital is larger than it has been for a long time,—some of them according to the local *Recorder*, of rather a malignant character. In many cases the patient is brought to hospital in the very last stage of the complaint, when recovery is almost hopeless.

FROM SCOTLAND.

Edinburgh.—This city has hitherto been without a single ringing peal of bells, although tunes have been played on the bells in the high church. At a recent meeting of the town council, however, Mr. Girle moved the adoption of the following motion:—"That, as it is desirable a peal of bells for occasions of processions, public rejoicings, &c. be introduced into one of the steeples in the High-street, it be remitted to the plans and works committee to ascertain its practicability." The motion was adopted. A chief difficulty will be to obtain ringers, as there are none in Edinburgh, nor even probably in Scotland.——A monument has been erected in the old Calton burying-ground to the memory of Mr. Charles Mackay, the famous old actor of *Bailie Nicol Jarvie*, and other of Sir Walter Scott's novel characters.

Glasgow.—The new church which has just been erected in Victoria-road, Glasgow, for the Rev. Alexander Cumming's congregation, has been opened for public worship. The church occupies a position at the junction of Victoria and Pollockshaws roads. The site is of a triangular shape. The building runs north and south, parallel to Victoria-road. It is in the Pointed style of architecture, being an adaptation of Early French. The church is seated for upwards of 1,020 persons, and the estimated cost is upwards of 6,000*l.* The building has been erected from the designs and under the superintendence of Mr. James Salmon.——Another church, erected in East Howard-street, for the accommodation of the Rev. P. Hately Waddell's congregation, has also been opened. The edifice has been built from the designs and under the superintendence of Mr. Robert M'Alister, architect. Externally, it is a plain-looking edifice. In the area and gallery accommodation is provided for about 1,300 sitters. For the reception of the preacher, or of speakers at congregational meetings, a platform has been erected, with a reading-desk in the centre. Behind the platform is a large

dow, filled in with partly obscured glass. Beneath the church is a hall, capable of accommodating about 300 persons, as also a school-house and vestry. The cost of the structure is understood to have been about 5,000*l*.

Kirkliston.—A flooding of the Almond river has broken down the wooden supports of the railway erected to lift the stones for the arches, twelve in number, of the bridge intended to carry trains over the branch railway from Ratho to Queensferry. The centre arch of the bridge, which is just opposite Kirkliston, was almost completed, and the two adjoining arches were also well advanced. The arches are on the skew principle; and not more than 1 ft. at side, and 3 ft. on the other, of the centre has required to be filled up. The centre arch of the bridge is entirely destroyed, and the arches on each side are so much damaged that both will have to be rebuilt. The loss to the railway company or the contractor by the flood is estimated at several hundred pounds. The arch, it may be stated, was not nearly so high as it is often seen in the winter months, and the reason assigned for its breaking the supports of the tramway is that, in the first place, these were rather slim; and, in the second, that there was a large number of tree roots and heavy branches brought down, which, striking against the wooden pillars in succession, finally overthrew them.

Newton Stewart.—The Ewart Institute here has been inaugurated. The edifice is in the decorated Gothic style, and is situate on the rising ground to the west of Newton Stewart. The building is of white stone, has a frontage of 70 feet, and has been erected at a cost of not much less than 4,000*l*. The free school is at the north end of the building; the high school at the south; and above the latter is the ladies' school, with music and sewing rooms. The free school has a large apartment, open to the roof, with pointed rafters, and measures 35 ft. by 21 ft. The grammar school is 45 ft. by 22 ft.; the girls' school, 38 ft. by 22 ft.; the music-room, 14 ft. by 11 ft.; and the drawing and sewing room, 21 ft. by 11 ft. The head-master's house occupies the centre of the building. The playgrounds are extensive, and there is a bath-house, in which the art of swimming may be practised with safety. The architects were Messrs. Nuttall & Cook, of Liverpool. The contractor was Mr. M'Culloch, and the sub-contractor, Mr. M'Kie.

CHURCH-BUILDING NEWS.

Soho.—The district church of St. Luke, Soho, situate in one of the most densely-populated districts of London, has been re-opened, after having undergone an entire renovation. The work has been done under the direction of Messrs. Cox and Mr. Teulon. All the seats are free and unappropriated.

New Brompton.—The chief stone of St. Mark's church has been laid. The edifice is of the Pointed period, and is plain and simple in design: it has an apsidal chancel, 39 ft. long by 24 ft. wide, and 46 ft. high to the apex of the roof, and is lighted with three two-light windows, with a quatrefoiled circle over. It is fitted with choir stalls, two steps above the nave, and the sacrarium rises four more steps to the altar. The chancel has lean-to aisles, parted from the chancel with iron grills. There is a second chancel arch at the commencement of the sacrarium, just beyond the stalls. The nave is 85 ft. long, 24 ft. wide, parted from the south aisles by arcades of five arches each, which carry the clerestory, pierced with coupled lancet lights over each arch. The arcade arches are each 17 ft. high, of two orders, springing from plain moulded caps on round piers. The aisles are of equal length with the nave, and are 12 ft. wide, each with a lean-to roof, the side walls being 13 ft. high, with coupled lancets in each bay, between which there are buttresses. The tower, of three stages, 20 ft. 6 in. square, and 63 ft. high, is at the extreme end of the south aisles, from which it projects. A broach spire, 90 ft. high, rises from the summit of the tower. A vestry, and organ-chamber over, occupy the north-east angle of the building. The west front of the nave has a five-light window, about 13 ft. wide, and 21 ft. high. The east and west ends of the aisles have two-light lancet windows, with a circle over. A contract for building the whole has been taken by Messrs. Wilkins, of Chatham, at a cost of 5,701*l*. The accommodation is for about 800 persons. The church has been designed by Mr. J. P. St. Aubyn, of London, and is being carried out under his superintendence. Mr. Corfield, of Rochester, surveyor, has the supervision of the works.

Codford St. Peter (*Wilts*).—The Church of Codford St. Peter, which has just undergone a restoration, is now re-opened. The church originally consisted of a nave, chancel, and tower at the west end. A north aisle has been added, which is connected with the nave by an arcade supported by three clustered piers. The old chancel arch has been replaced by a pointed arch, supported by Devonshire marble shafts, on carved corbels. The ceiling of the chancel is of wood, in panel, with carvings at the intersections of the mouldings. The chancel has been rebuilt, in the Decorated style, the old proportions being preserved. The nave and north aisle are in the Perpendicular style, the former having an open stained high-pitched roof, the having supported by carved freestone principals corbels. A wooden gallery, which was formerly placed at the west end of the church, has been removed, and the tower arch, which was concealed, has been thrown open. The basement of the tower is fitted up with seats. The new north aisle corresponds with the nave in style, and is lighted with three windows, of double lights, with trefoiled heads. The nave is lighted with two windows of Perpendicular character. The corbels, which are all of freestone are Naturalesque in design. They are the work of Mr. Sansom, of Lambeth. There are several stained-glass windows in the church. The east window which is in the Decorated style, has three lights, and is filled with stained glass. In the centre is the "Crucifixion;" above is a representation of "Our Saviour crowned with Thorns;" and below is "The Saviour bearing the Cross." In the upper compartment, on the north side, is "The Agony in the Garden," and below it "The Last Supper." On the south side is "The Resurrection" and "Our Lord's Appearance to Mary in the Garden." On the south side of the chancel is another stained-glass window, in the Decorated style, with two lights. In the quatrefoil above are the cross-keys, and in the west light is "The Transfiguration," the other light having a representation of "Christ walking on the Waves, followed by St. Peter. The west window, in the tower, has three lights, the subject being "The Adoration of the Shepherds and the Magi, supported by Angels." These three windows were executed by Messrs. Heaton, Butler, & Bayne, of London. The window behind the pulpit on the south side has a figure of St. Peter. The west window of the aisle is of plain diaper glass, and is the work of Messrs. Lavers & Barrand. The south porch has been rebuilt, a portion of the original materials having been worked in, and the old battlements and gurgoyles have been preserved. The organ, which is placed at the east end of the aisle, has been repaired by Sweetland, of Bath. The church is warmed by Haden, of Trowbridge. The designs for the restoration of the edifice were furnished by Mr. T. H. Wyatt, the diocesan architect, and the work has been executed by Mr. Barnden, of Warminster, the contractor. The iron gates are by Singer, of Frome. The churchyard has been levelled 3 ft., and the wall taken down. There is a new clock dial, given by Mr. Wyatt, on the south side of the tower. With regard to the exterior of the edifice, the tower, which has been preserved, is crowned with battlements, having pinnacles at the angles. During the progress of the works, part of an ancient stone cross was found in the masonry of the old chancel arch. It is of Norman character, and is affixed to the north wall of the chancel.

Horton (*Staffordshire*).—The Church of St. Michael, Horton, has been restored and re-opened. It is of Late Perpendicular date, and consisted of nave, north aisle, and tower, to which a new south aisle, with porch, has been added, the details adapted to those of the original edifice. A new chancel window has been introduced, filled with stained glass, by Mr. Wailes, and is the gift of the late Mr. Thomas Crompton, of Dunwood House and Manchester. The remainder of the windows in the chancel, and those in the north aisle and tower have been restored, and one in the north aisle is filled with stained glass, the gift of the Misses Crompton. The gallery at the west end of the nave has been removed, and the second stage of the tower re-opened into the nave. The organ, which stood in the gallery, has been removed to the east end of the south aisle. The nave and chancel roofs have been opened by the removal of the lath and plaster ceilings beneath. The old timbers of the roofs have all been wrought and chamfered, and moulded ribs have been added to the nave roof, dividing it into panels, with carving at the intersections of the ribs. A new arch of wood, with pierced spandrel and soffit, has been introduced between the chancel and the nave, springing from stone corbels. New pinnacles have been put to the tower parapet, and dilapidations of the exterior generally have been made good. The works have been carried out by Mr. John Naden, of Leek, and Mr. Samuel Heath, of Gratton, under the direction of Mr. Sugden, of Leek, architect. The churchyard has been enlarged to the extent of about 1,000 yards, the gift of Mr. A. C. Watt, the owner of the Horton Hall estate. At the south-east corner an approach has been erected, with wing walls and steps of Kerridge stone; and the gates and pillars at all the south entrances are new, and correspond with those of the north side.

Acock's Green.—The foundation-stone of the new church of St. Mary, Acock's Green, in the parish of Yardley, has been laid. The portion of the church which it is proposed to erect at once will cost about 3,000*l*. Of this sum 2,270*l*. have already been subscribed. The church will be in the style of architecture which prevailed in the latter part of the thirteenth century, but of a Continental rather than an English character. It will consist of nave, aisles, transept, chancel, &c. There will be a porch on the north, and a tower, with spire, at the west end. The height to apex of spire will be 180 ft. When complete, the church will seat 900 persons. The exterior will be of Hampstead stone, with Bath stone dressings. The interior will be faced with brick-work, in ornamental patterns, with red ground and blue bands, &c. The arches and dressings of the interior will be of Bath stone; the columns of the nave of yellow Mansfield stone, with foliated capitals of Bath stone. The contractors for the works are Messrs. Jefferies & Pritchard; the architect, Mr. J. G. Bland.

Snowshill.—A new church at Snowshill, a village in the most inaccessible part of the Cotswold Hills, has been consecrated by the bishop of the diocese. The ancient church had become so much dilapidated that it was found impossible to repair it. The population of the village is only about 240, and accommodation has been provided in the church just consecrated for 150 persons. The style is Early Decorated. The church consists of nave and chancel, with small tower, which is intended to be crowned by a spire 90 ft. in height. All the stone has been raised in the neighbouring quarries at Stanway, the property of the Earl of Wemyss. That used for the general walling is the common stone of the district: that used for the windows, doorways, and dressings externally, is a very hard material, and although much more difficult to work than freestone, has been selected on account of its durability. For the internal dressings a white local freestone has been adopted. The flooring of the nave and chancel is of Minton's tiles, mixed with local blue limestone. The seats are all of oak. The roof timbers are exposed, and are stained and varnished. There is a south entrance porch, and ornamental crosses surmount the gables. Messrs. Chidley & Edwards, of Stanway, were the builders. A memorial window has been erected at the east end of the chancel by the family of the late Mr. C. Marshall. The cost of the church and chancel (the latter the gift of the incumbent, the Rev. W. H. Bloxsome) is about 1,700*l*.

Yarmouth.—The church of St. Nicholas, some time in the course of restoration, was opened on the 21st, with considerable ceremony, a portion only of the contemplated works being completed. This includes the central tower, the arcades which form the abutments thereto, the parapets and pinnacles to the same, and the whole of the church east of the tower. Of the tower, the defective portions of the walls (including the whole of the facing of the lower and central parts) have been cut out and reinstated. The walls blocking up the arches which divide the nave from the chancel and its aisles, have been taken down, thus throwing open the whole of the area. The east end has been taken down and lengthened to the full extent. A five-light window of the Geometric Decorated period, with bold angle turrets on either side, form the principal features of the new eastern façade. The tracery head of the above window is fitted in with stained glass by Messrs. Morris & Marshall, from designs by the architect. The remainder of the window and the whole of the two new side windows are fitted in for the present with clear glass. The whole of the chancel is covered in with a new roof of English oak, boarded inside. The roof is covered externally

with lead, and is finished at the ridge with ornamental lead cresting. The leadwork of roof, &c., was executed by Mr. Woolverton, of Yarmouth. New sedilia have been erected. The portion of the chancel east of altar-rail has been laid with encaustic tiles, by Mr. Godwin, of Lugwardine. The remainder of the chancel has had a bed of concrete, 2 ft. thick, laid over its whole surface, and floated to an even face, so as to receive ultimately such flooring as may be determined on. The stone used in the construction of the works is Ancaster stone, from the quarries of Mr. Thompson. The whole amount expended on the works up to the present time is nearly 6,000*l.*, a portion of which still remains to be subscribed. The architect was Mr. J. P. Seddon; first, Mr. A. W. Morant, and then Mr. J. T. Bottle, acting under him. The contractor was Mr. Thomas Williams, of Cardiff: his foreman of works was Mr. William Sier. The carving was executed by Mr. Allen, of London.

DISSENTING CHURCH-BUILDING NEWS.

Stanstead (*Essex*).—The first stone of the new chapel, about to be erected in this village, has been laid by Mr. J. Perry, of Chelmsford. The chapel is to cost about 1,400*l.*, towards which the congregation, aided by friends, have already contributed 1,100*l.*, leaving only 300*l.* to be raised. The architect is Mr. Jasper Cowell, formerly of Henham, now of Islington. The style will be Italian, freely treated, the dimensions being 62 ft. by 40 ft. in the extreme.

Stratford (*Essex*).—The foundation-stone of a Presbyterian church has been laid here. The style is Early English, freely treated. The walls externally will be faced with picked seconds, intermixed with a few bands of white bricks, the jambs and mullions, dressings, and spire of Bath stone. The church, with galleries, will accommodate 800 persons, and is to be divided internally with nave and aisles by iron columns, which will carry the galleries and continue in support of the roofs. The ceiling is of an octangular form, the upright portion being formed in the plaster to represent an arcade: the remainder is to be subdivided into panels by moulded ribs. The galleries will not be wholly enclosed, but the upper half under the moulded edge of the book-board is to be filled in with scroll iron panels, similar to the rostrum. The lecture-hall and vestries, with the other requisite offices, will flank the church, and the latter will accommodate 200 persons. The cost of the whole will be about 5,800*l.* Mr. Alexander Peebles, of London, is the architect, and Mr. Thomas Ennor the contractor.

Tiptree.—The newly-erected Congregational church at Tiptree-heath has been opened for public worship. The new edifice is situate upon the site of the former meeting-house, and is capable of affording sitting accommodation for about 500 persons. The building in plan is in the form of a cross, with minister's vestry, and two class-rooms in the rear, faced externally with white bricks, and bands, cornices, and dressings to the windows, and doorways of red bricks, the roofs being covered with tiles and ornamental ridge crests. The windows are Early English lancets, glazed with Hartley's opaque glass in imitation quarries. The principal front has the entrance porch (with the memorial stone in the gable) leading to the body of the chapel, and side porches containing stone staircases to the galleries. Over the centre entrance is a triple window filling the front gable, and a similar window in each transept, the gables being capped with stone coping and finials. The galleries extend round three sides and into the transepts. The interior fittings are of varnished pine. The roof is open to the ridge, the ceiling plastered, showing the principal timbers, which are stained and varnished, and formed into arches spanning the nave and transepts. The walls internally are stuccoed and lined out as stonework. The heating is by a stove with descending flue into the chimney of the vestry; the ventilation by hopper casements in the windows and Sherringham's patent ventilators in the four gables and at intervals under the eaves. Accommodation is provided in open benches for 560 persons, including about 120 children. The contract was taken by Mr. Holland, of Sudbury, by whom the building has been executed for 970*l.* from the designs of Mr. F. Baines, of Ipswich, architect.

Harborne.—The memorial stone of a new Baptist chapel at Harborne has been laid by Sir Morton Peto, Bart., M.P. The building will accommodate about 300 persons. It will be of red brick with Bath-stone dressings. There will be two turrets 54 ft. high, one on each side of the entrance. Mr. Phipson is the architect; and Mr. Matthews the contractor.

Liverpool.—The new Presbyterian Church at Fairfield, erected in connexion with the Lancashire Presbytery, and the foundation-stone of which was laid in August last year, has been opened for public worship. The erection is in the Gothic style, from designs by Mr. Mason, of Castle-street, and has been built at a cost of 2,900*l.*, of which more than one-half is already paid. Mr. Urmson was the builder. There is accommodation for 440 persons.

STAINED GLASS.

Hawkhurst Church (*Kent*).—This edifice will shortly have two more stained-glass windows, one of which has been in hand some time, and is to be placed over the west door of the church. The subject of this window is Baptism, and it is the gift of Colonel Lloyd, of Lillesden. The second is now about to be commenced, and is to be put in the east end of the south aisle. The subject of this is to be the Resurrection, and the giver is Captain Jenings, of Elm-hill, in memory of his late wife. Messrs. Clayton & Bell are engaged on both of them.

Sutton Coldfield Church.—The chancel window of the parish church has been recently filled with stained glass by the rector as a memorial of his late father. The window is large, and of a peculiar style, neither Decorated nor Perpendicular, but partaking of a mixture of both. The various compartments present the following subjects:—The three upper lights in the tracery represent the Trinity, to whom the church is dedicated. The centre has Christ as God in an elliptic aureole, or glory: the other two lights have, Christ as man, holding, as an emblem of the Trinity, the intersection of the two triangles; and Christ the Holy Ghost with the figure of the Dove on His breast. In Christian "Iconography," the God *par excellence* is Jesus. In the four next lights of the tracery are, first, Bishop Vesey, the benefactor of Sutton, kneeling in the attitude of prayer. In the two next lights of the tracery are St. Peter, with a key, and St. Paul, with a sword in his hand, the patron saints of Exeter Cathedral, of which Vesey was bishop. The fourth light contains St. John the Baptist, with a lamb in his right hand, and in his left a flag, inscribed "*Ecce Agnus Dei.*" The five lower lights are filled as follows: first, on the north, "The Annunciation," the Angel Gabriel appearing to the Virgin Mary and pointing to the dove, symbol of the Holy Ghost, in the cloud overhead: in the lower part of the light is an angel bearing a scroll, with "Behold the handmaid of the Lord." The second light has the "Adoration of the Shepherds," "the heavenly host" appearing above; and below is an angel with a scroll, "Unto you is born a Saviour." The centre light has Christ on the cross, with a nimbus around His head, and the three Maries at His feet: below is an angel with a scroll, "It is finished." The fourth light has the Baptism of Christ in the River Jordan, by St. John the Baptist, with the Holy Dove above, and beneath an angel bearing a scroll, "To fulfil all righteousness." The fifth light is "The Agony in the Garden."

Feniton Church (*Devon*).—A three-light stained-glass window has just been placed in the chancel of Feniton parish church, as a memorial of the late Sir John Patteson.

Wythall Church (*near Birmingham*).—A large stained-glass west window has been erected in this church, designed and executed by Messrs. W. Holland & Son, of Warwick, in the Early Gothic style, containing in the large wheel opening the Ascension of our Lord, with the figures of the eleven apostles, surrounded by angels bearing the crown, palm branches, musical instruments, inscriptions, &c. Underneath, in the large single window, are the Nativity and Baptism, with inscription across the bottom. Between the above is a large cross, emblazoned in gold and colours with the emblems of the Evangelists at the corners, and I.H.S. in the centre, entwined with a ribbon having the words, "I ascend unto my Father and your Father, and to my God and your God."

Holy Trinity Church, Meanwood (*Leeds*).—Two stained-glass windows have been placed in this church, one in memory of the late Misses Beckett, the founders, and the other in memory of the late Mr. C. Beckett. The windows a lancet-shaped, and that in the south transe has two lights, containing the following subject illustrative of the history of our Lord:—T Annunciation, the Worshipping of the Ma Christ with the Doctors in the Temple, t Baptism, the Temptation, and Transfiguration Christ. The east window has three lights, larger dimensions than the others; and the ce tral light is filled with four of the closing scen of Christ's life, and the side lights have ea four subjects from the Old Testament, typical those in the centre. At the upper part of th middle light is the Ascension. Typical of th is the Translation of Enoch on the one side, a on the other the Translation of Elijah. Und the Ascension is the Resurrection, with its type the Raising of Joseph from the Pit, and th Landing of the Prophet Jonah. Next belo these are the Crucifixion and the Offering up Isaac, and Moses raising the Brazen Serpent, typical of it. The lower part of this window h the Last Supper, and types—the Fall of Mann and Moses striking the Rock. The window have been executed by Mr. Preedie, of London.

Miscellaneous.—Some months ago, says th *Carlisle Journal*, we stated that Messrs. Joh Scott & Son, of this city, had received commi sions for two stained glass windows—one fo Bombay, the other for Dundee. The first these has now been executed. It is a triple lancet memorial window, in the Early Englis style. The subjects represented are the An nunciation, the Shepherds watching, the Birt of the Saviour, on the right; the Crucifixio the Resurrection and Ascension, in the centre and the Wise Men's Offering, the Presentatio in the Temple, and the Flight into Egypt, on th left. The other window, intended for Dunde is rapidly approaching completion. This is two-light window in the Decorated style. Th most prominent features of this window are tw large figures of the Saviour. One of these i taken from Holman Hunt's celebrated picture "The Light of the World," and the other is companion figure, "I am the Bread of Life." Beneath these chief figures are two groups "Healing the Blind," and "The Marriage a Cana;" and the window will be finished abov in tabernacle and other canopy work.——W some time ago, says the *Shrewsbury Sentinel* drew attention to a stained glass window, th work of Messrs. Done & Davies, of this town and which was placed in the cemetery chapel, i memory of Mr. D. Evans, and of his son, Mr. C Evans. A few days ago we had an opportunity of inspecting another stained-glass window, exe cuted by the above firm for the Rev. E. C Swainson, who intends to have it placed in St Michael's Chapel, Coom Head, near Marsh Brook, which is being restored. It is a smal Norman window, the subject being the Crucifixion. Over the cross is a canopy of foliated ornament; and in the lower part of the window is a richly-coloured pedestal of the passion flower and foliage. A border runs round the whole.

MUSIC AND ENTERTAINMENTS.

Royal English Opera.—We must wait for the production of a fresh opera before pronouncing on the undertaking of the new Opera Company who, with a good capital subscribed, now hold Covent Garden Theatre. "Masaniello" and "Martha," while they afford the great advantage of coming at once before the public with magnificent appointments ready to hand, have the disadvantage of subjecting the singers to severe comparisons fresh in memory. Mdlle. Parepa and Mdme. Lemmens-Sherrington come out of the ordeal with flying colours; but we cannot say quite as much for some other members of the company. As Mr. Macfarren's "Helvellyn" is announced for next week we shall not have to wait long. Mr. Adams, the new tenor, promises to be a valuable addition to our operatic stage. Mr. Alfred Mellon, as conductor, and Mr. A. Harris, stage-manager, are two good cards in the company's hand.

St. James's Hall.—On Tuesday last, Professor Anderson demonstrated very clearly and cleverly, to a Hall-ful of invited guests, that the rapid untying and tying again of persons securely bound up, on which the performances of the Davenport, Fay, & Palmer party are founded, can be performed without supernatural interference. Such evidence ought not to be needed, but it seems that it is. A large number of gentlemen connected with periodical literature were present, and a committee of a

zen or fifteen persons was appointed to see all r. This included Mr. Tom Taylor, Mr. Bayle rnaul, Mr. Henry Mayhew, Dr. Wakley, Mr. dwin, Captain Burton, Mr. Friswell, Dr. Rees, . John Hollingshead (as chairman), and others ose names are known. The daily papers have fully reported what took place that it is ecessary to go over the same ground. Suffice to say that in the experiment where Mr. Ander-'s clever little daughter and his treasurer were ced in "the structure" most securely bound, horn and bell were thrown through the aper-e in the door in one-third of a minute after binding, the treasurer's coat came through half a minute, and in one minute and three arters, when the doors were opened, the two erators were found hand in hand, free, bow-g to the audience. Whether or not the tricks re done quite as well by these experimenters, o are new to the work, as by the American rty, with a dozen years' practice, is of no con-quence whatever. Thanks were properly given the Wizard for the entertainment he had rded, and for the good that ought to grow t of it.

New Theatre, Manchester.—The number of perficial yards covered by the new theatre is 0, the architect tells us, not 480 as stated. On e opening night there were above 1,900 persons esent.

Books Received.

VARIORUM.

"The Relations of the Industry of Canada th the Mother Country and the United States," well, Montreal, publisher, is the report of a eech delivered by Mr. Isaac Buchanan, M.P.P., a political meeting; and the volume, which is ited by Mr. H. J. Morgan, author of "Sketches celebrated Canadians," also contains the print of a series of newspaper articles by Mr. uchanan, in defence of the national sentiments ntained therein; and the report of another eech delivered at a dinner to the Pioneers of pper Canada. There are also copious notes d annotations, introductory explanations, and pendix. In anything written or spoken by a an of ability, and of local celebrity, on the in-strial welfare and progress of Canada, we nnot but all feel interested here at home. The neral principle long held by Mr. Buchanan, d pervading all his speeches and writings, may thus epitomised:—"That while we in Canada ve no wish farther to increase our Customs ities, and while we look to doing away entirely ith those on tea, sugar, and all articles which e do not grow or manufacture, our provincial licy is not to incur debt for anything we can roid; and we shall never consent to reduce,—herwise than as a matter of reciprocity with e United States,—the duties on articles which e can grow or manufacture."——"Lancashire sistress and Emigration to Australia." This mphlet contains two letters addressed to rd Derby, as Chairman of the Central Dis-ess Committee, by "An Old Colonist." He aintains that in Victoria, the yield of gold as diminished; the value of property has ecreased; the rate of wages has declined; *audulent dividends* have been paid by eculative establishments; the revenue of e colony has declined and is still declining; nd it is now, and long has been, their great oject to stifle inquiry and to prevent the truth eing known. Wages, he asserts, "it is now dmitted are, for unskilled labourers, literally wer than in England; and for skilled arti-ans, in most cases where broken and lost time t taken into consideration, no higher; and even e *Melbourne Argus* for July 25th gives currency b the statement that the inquiry for labour of ll descriptions is very limited." The great squatting interest, he declares, is the only thing nat is sound in the colony.——"London Noises, isturbing Sleep. By C. J. B. Aldis, M.D., Medi-al Officer of Health to St. George's, Hanover-quare. Churchill, New Burlington-street." Dr. ldis will far more merit the public thanks than lessrs. Babbage and Bass for the suppression of rgan-grinding, should he succeed in silencing, y night, within the wide bounds of the metro-olis, the cocks that *will* crow, the dogs that will ark, the horses that will kick, the trains that ill screech and groan, and the donkeys (of rivers orders) that will bray, making night ideous, and murdering sleep. Apart, however, rom all night noises in the back settlements, here are other acoustic annoyances, even by day, than the poor organ-grinders, much requiring abatement. For example, while engaged, as at present, with literary work, in our *sanctum*, we are every morning, and literally for hours, serenaded by a lady neighbour behind the fireplace, who is making most persevering and commendable efforts to master the *piano*, or rather the *forte*. A little of this gratuitous music occasionally, executed by a skilful hand, might be tolerable, even during the hours of literary labour; but we need not attempt to describe the nervous condition excited by a pertinacious effort, of several hours' continuance, to master sometimes even a single tune. Could Dr. Aldis put a stop to such a nuisance as this, we should hold him entitled to a professional fee.——"An Answer to Report of the Commissioners in respect to Wall Paintings for the Palace of Westminster," by a Silent Member (Vickers), is a strong but quite justifiable protest against the want of consideration shown to Mr. Maclise, R.A. The commissioners admit to the fullest in their report that Mr. Maclise has devoted himself unselfishly to what he has undertaken, and will complete two works of unusual magnitude within a reasonable period of time; and yet, with obvious inconsistency, they treat him precisely as they do those who have refused or neglected to fulfil their engagements. We cannot suppose for a moment that their recommendation, in Mr. Maclise's case, will be attended to.——The current *Quarterly* contains an interesting article on "Workmen's Benefit Societies," showing the enormous extent of these organizations and their usefulness. Few persons are aware that the income of the largest,—the Manchester Unity of Odd Fellows,—is about 350,000*l.* a year; of which some 300,000*l.* are annually expended amongst the members, chiefly in sick relief; this large fund being raised by voluntary contributions, at the rate of about 5d. a week. "The Sanitary State of the Army in India," and "Photography," are also well treated of.——"Packing-case Tables" (Lockwood & Co.), compiled by W. Richardson, accountant, show the number of superficial feet in boxes or packing-cases, from 6 in. square up to large sizes.

Miscellanea.

Sham Antiquities at the Embankment.—Mr. Chubb writes,—A friend has just called in to show me three bronze keys of Roman manufacture, which he purchased from a navvy who had dug them out at the Thames Enbankment! On examination I found them to be recent castings, with the moulding sand in the interstices. I understand that a number of these and similar antiques are on sale by the industrious navvies at the embankment.

Liverpool Architectural Society.—At the last meeting, Mr. Boult presided. He announced that the subject for the next competition of student-members would be a music hall. If there were more than three competitors, two prizes would be given. Mr. Francis Horner read a paper entitled "Notes on Originality in Art," upon which discussion took place. Two volumes of photographs, taken in the neighbourhood of Bombay, and comprising views of a number of the rock temples, were exhibited by Mr. J. P. Bradley.

Exhibition at Bayonne.—A Franco-Spanish International Exhibition has been held in Bayonne, which has only recently closed. The building was a temporary structure of wood and canvas, lighted from the top with a portico of the same material, decorated with the arms of France, Paris, Madrid, and the Spanish provinces represented by their products. At first the price of admission was over 2 fr., but towards the close it was reduced to 50c., except on one day in the week, when a franc was charged.

Proposed Opening of Southwark Bridge.—In the Court of Common Council last week, a motion brought before the court was a recommendation by the Bridge-house Committee, that the proposal made by the Southwark Bridge Company to open that bridge free to the public for six months, for the sum of 1,834*l.*, and for a further period of six months for the sum of 2,750*l.*, be accepted. The matter gave rise to a very stormy discussion, but ultimately the motion was carried in the face of two amendments. Some technical obstacle, however, still remains to be overcome, the Coal, Corn, and Finance Committee having a say in the matter.

Fire at Blackfriars Railway Station.—A fire recently broke out in the booking-office of the Blackfriars Railway Station. Fortunately the flames were prevented from extending, and they were altogether put out before the arrival of the engines. The booking-office is entirely burnt out. The fire arose from an escape of gas. A temporary booking-office has been arranged, and fresh tickets obtained.

Norwich School of Art.—The annual distribution of the prizes to the students of this school has taken place. Mr. Barwell, in opening the meeting, explained that a deputation of nearly 100 gentlemen from various schools of art had gone to the Privy Council Office, and had an interview with Lord Granville, the result of which was, that certain modifications in past arrangements were agreed to, as well as measures for the obtainment of a parliamentary committee on the grievances of the provincial schools. The Rev. A. Jessop, delivered the prizes, which included eighteen medals, and many other prizes and certificates of merit.

Medical Officer of Health for Marylebone.—On the day appointed for the reception of candidates for the appointment of medical officer of health for Marylebone, the applications were four in number, viz., from Dr. J. J. Gillan, of Aberdeen and Surgeons' Hall; Dr. J. Stevenson, member of the Colleges of Physicians and Surgeons, and Bachelor of Medicine in the University of London; Mr. S. H. Marshall, Licentiate of the Faculty of Physicians and Surgeons of Glasgow; and Dr. J. Whitmore, St. Andrew's, Licentiate of the Apothecaries' Company, and Member of the Royal College of Surgeons. On the numbers being taken there were—for Dr. Gillan, 1; for Dr. Stevenson, 24; for Dr. Marshall, 0; for Dr. Whitmore, 60. The chairman declared that Dr. Whitmore and Dr. Stevenson were the selected candidates to go to the ballot.

New Docks.—Plans have been prepared of extensive docks to be made at Burnham, on Bridgwater bay, Somerset, or rather between Burnham and Highbridge, on the Great Western line; and application is to be made to Parliament next session for the usual powers to constitute the company. The contractors, who are also promoters of the new docks, will be Messrs. Waring, Brothers.——At a recent meeting of the Lynn Town-council a plan and report by Messrs. Brunlees & Bruce, C.E., were produced, for the formation of a dock of 6½ acres, with spacious lock entrance at the north end of the harbour, and with branch lines from the Great Eastern and Sutton-bridge lines, at a total estimated cost of 60,000*l.* It is intended to bring the subject before a special meeting of the council, and to ask them for a vote of 20,000*l.* towards the project; and the promoters entertain hopes that the Great Eastern, Great Northern, and Midland Railway Companies will subscribe the whole or part of the balance.

The Sanitary Condition of St. Mary's, Islington.—The report for September, as prepared by Dr. Ballard, medical officer of health, states that the registered mortality for the five weeks ending October 1st amounts to 320, which, although short of that in Septeraber last year, is still 21 above the corrected mean of eight years. The excess appears principally due to an unusual number of deaths from consumption and diseases of the chest. Of the nine deaths from fever registered, four are stated to have been caused by "typhus." Scarlet fever appears again to be on the increase, the deaths having risen from six in four weeks to fifteen in five weeks. The weekly mortality from it was 5, 4, 9, 3, 8. Of the three deaths from small-pox, one was of an unvaccinated child in Adelaide-square. This is the fourth death from small-pox in Adelaide-square during the last few months. The returns made by the Islington inspector of bakehouses, who since his appointment has visited 192 bakehouses, disclose a shocking state of matters, both as regards the health of the workmen and the purity of the bread. In several instances there are even privies in the very bakehouses! In one of three such cases there was neither trap nor pan,—nothing but a mere wooden bar across an open drain. In one instance the foul slop from a drain lay among the baker's feet at the trough. A pork-pie baker has just been convicted of keeping a dirty bakehouse, in which a horse was stabled! These and such like disclosures are more than enough to disgust the public altogether with "the staff of life" as supplied by the public bakers.

Heston Church Demolition.—At a special council meeting of the London and Middlesex Archæological Society, held at the Society's Rooms, Mr. J. W. Butterworth, F.S.A., in the chair, it was resolved:—

"That this meeting, having heard that it is in contemplation to destroy the parish church of Heston, which contains many features of archæological interest, considers that a respectful protest should be made and forwarded to the proper authorities."

This was accordingly done.

Academy of Brussels.—M. de Keyser, recently appointed director of the Belgian Academy, has just made his inaugural speech. He concluded with an energetic protest against the idea of a school departing from its traditions, its original idea, and attempting to graft in its stock the taste and the methods of another and a different one; concluding with a declaration that, in his opinion, mural painting—of which, however, he spoke with the greatest respect—was utterly opposed to the spirit of Flemish art, of which Rubens might be taken as the most splendid embodiment.

Manufacture of Zinc White.—An invention has been patented by Mr. George Darlington, of Minera, which consists in the production of zinc white (white oxide of zinc), from oxidised compounds of zinc, such as roasted blende, calcined calamines, zinc ashes, zinc dross, or old zinc, by mixing such materials with coal or coke from which all their original gaseous matters have been expelled by heat or any other well-known means, the proportion of such admixture being usually about three parts of fuel to one part of metal contained in the ore, but such proportion being necessarily dependent upon the fusibility of the gangue of the ore, the proportion of fuel to be increased or decreased as the ore is difficult or easy of fusion.

Electric Submarine Light.—This light has been tried, and proves, it is said, successful. In the midst of the darkest night, rendered darker still by a heavy fall of rain, the basin of Lorient, 100 yards in length, was lighted up as if by the sun at noon-day. The *Dinhayla*, lying at anchor at 100 yards distant, and the *Panama*, somewhat nearer, were both found to answer immediately to signals shown by the electric light. A diver descending to a depth of 6 yards in the sea, and at the same distance from the lanthorn, was enabled to distinguish the numbers on a carpenter's foot-rule, which was thrown to him. These experiments are thought to be conclusive as to the utility and value of the light.

Fuller's Telegraph Computor.—Until this little machine has been seen, says the *Star*, it is scarcely possible to understand how completely a mechanical contrivance can be made to do all kinds of computations. Perfectly simple and intelligible in plan, it is capable of solving almost any problem in arithmetic. At one operation it does both multiplication and division. Interest is calculated to the most perfect nicety. The possessor of the machine may gauge the contents of any vessel in a minute. The most intricate calculations are worked with the most perfect ease and simplicity. The principle upon which the machine is based is that of the ordinary sliding scale.

Railway Matters.—Plans for a central railway station for Manchester have been completed, in readiness for the usual Parliamentary notices of a scheme to be advertised next month, and the project itself has originated with one of the leading minds engaged in the administration of railway affairs. —— Surveying staffs are busily engaged, and plans are preparing, for a line of railway from Leeds to Hartlepool. The line is to commence at Leeds in connexion with the London and North-Western, and will pass, *viâ* Wetherby, Easingwold, and Helmsley, up Belsdale to Stockton-on-the-Tees. The country is one, although in the north-eastern district, quite unserved by railways. The line is to cross the Church Fenton and Harrogate, the York and Knaresborough, the Great North of England, the Malton and Thirsk, and the Stokesley Railways, and by a tunnel through Ingleby Bank to join the West Hartlepool Railway, thus gaining access to the great iron, coal, and shipping interests of the North. At Helmsley it is intended to form a branch, by way of Kirby-moorside, and Pickering (crossing the Malton and Whitby line), to Scarborough. The total length of this railway project is about 100 miles. The estimate is stated to be 1,500,000*l.* or 15,000*l.* a mile.

The New Covered Market in Derby.—The following is from the *Derbyshire Advertiser*. The dimensions of the Birmingham Market Hall are 363 ft. in length, 101 ft. in width, and mean height, from floor to top of roof, 50 ft. Those of the Derby Market Hall will be, in length 220 ft., 110 ft. in width, and in height, at the centre, 75 ft. The area of the Birmingham hall is equal to about 36,000, and that of Derby, 24,200 square feet; but the available space in the former is not so much greater in proportion, in consequence of the larger number of supporting columns used in its erection. The roof of the Derby Hall will be of one semicircular span of nearly 90 ft., and its extra height will render its cubic contents very nearly equal to that of Birmingham, while, at the same time, much greater facility is given to ventilation. The whole of the columns and spandrels for the sides are in their places, and several of the wrought-iron ribs are ready for raising, so soon as the cast-iron work is finished. The only features of the hall which afford room for regret are the absence of galleries in the plans, and the narrowness of two of the entrances.

Manchester and Salford Sanitary Association.—An address by Mr. T. Turner has been delivered at Manchester, introductory to an intended series of lectures on sanitary subjects, projected under the auspices of the above association. The mayor presided. In course of his address, Mr. Turner said,—One of the greatest difficulties the association had to contend with was ignorance. The poor were ignorant of the circumstances under which they lived; of the effects of foul air; of what entered into their system in the form of food. The association's object was to remove this ignorance. Their lectures were attended with regularity, and listened to with interest. Since the commencement of the association fully 500 lectures had been delivered to the poor in different schoolrooms and other buildings, the average attendance being about 500 persons. The association had also published 100,000 tracts, of which 60,000 had been bought and distributed, and cards containing information with respect to the treatment of children and of certain diseases of a contagious character, had been distributed to the number of from 30,000 to 40,000. House-to-house visitation had also been tried, and in this the Ladies' Association and the City Missionaries had rendered very efficient help. The newspaper press of Manchester had placed the association under the deepest obligation for the assistance they had rendered in giving publicity to the weekly reports, and in making their objects known in other ways.

Utilization of Sewage.—The Metropolitan Board of Works have intimated to the Carlisle Local Board of Health their intention to visit Carlisle this Saturday, with a view of inspecting the works now in operation in that city for the utilization of sewage. The sewage of the town, first deodorized by Mr. M'Dougall's patent, is pumped into a main canal, from which it is dispersed over any part of the soil of 80 acres where it is required, by means of smaller gutters. This irrigation of the meadows is said to be attended with the most beneficial results. The earthen trenches becoming choked up, movable iron pipes were substituted for the aqueducts which communicated with the main canal. The whole of the sewage of the town, it is said, has been applied to the land, and it has not been found at all too much for the area to be irrigated; experience showing that more might be applied with good results to these 80 acres. The deodorization has been complete. Although the meadows are close to the town, and surrounded by favourite public walks, not the least complaint has been made of any offensive smell. During the past summer, when all the neighbouring pastures were brown and bare, these meadows were green and luxuriant. The chairman of the Metropolitan Board of Works, in his letter to the Carlisle Local Board, says the Board have been informed that the operations of Mr. M'Dougall, at Carlisle, "have been attended with considerable success;" "but they feel, before accepting in their full extent those favourable reports, that it is their duty to ascertain, from independent testimony of the municipal authorities, how far the method of application may be consistent with public convenience, more especially in its sanitary bearings." Hence their proposed visit to Carlisle. They also intend, it is stated, to extend their sanitary tour to Edinburgh.

Relics of Ancient Liverpool.—In turning the corner of South John-street and Canning place, with the new sewer, it became necessar to sink it 3 ft. below the level of the existin one, and as the excavations were being drive northward, along the middle of the street, o nearly so, the workmen came upon a well 26 f deep from the surface (filled with salt wate which moves with the tide), and 5 ft. square The brick arch on being removed exposed th heads of two English oak trees, placed on th right and left side of the well, and grooved a though they had been the uprights of a clough probably used either as a sewage outfall, or sluice from the old pool for keeping the old doc as clear of mud as possible, in the days when most likely, dredging-machines were unknown About fifty yards farther up the street, two mor wells have been struck. These wells, or rathe the tidal waters which they disclose, are likel to give trouble.

TENDERS.

For the erection of schools of Our Lady of Moun Carmel, Liverpool. Mr. Pugin, architect:—

Middlehurst	£2,138	0	0
Ward, Brothers	1,930	0	0
Rome	1,870	0	0
Baynes	1,832	0	0
Glaister	1,820	0	0
Hughes (accepted)	1,700	0	0

For bar-fittings and decorations to hotel, South Lam beth, for Mr. E. Fitzgerald. Mr. W. F. Potter, archi tect:—

Steed	£270	0	0
Williams & Jenkin	228	15	0
Honour	225	0	0
Moore	202	0	0
Hore	200	0	0
Warne	187	0	0
Sabey & Son (accepted)	175	0	0

For pewterer's work to same:—

Gallicane	£95	15	0
Richards	93	15	0
Bowen	90	0	0
Warne	85	0	0
Helling (accepted)	75	0	0

For repairs and alterations to the Crown Tavern High-street, Southwark. Mr. Isaac Bird, architect:—

Downes	£936	0	0
Brown	812	0	0
Ebbs & Sons	808	18	0
Williams	787	0	0

For alterations, &c., at Shottery Hall, near Stratford on-Avon, for Captain Curry, R.N. Mr. Joseph Lattimer architect:—

Branston & Murray	£6,370	0	0
J. & G. Callaway	6,115	0	0
Marriott	5,975	0	0
Bennett	5,400	0	0
Green	5,300	0	0
Street & Birch	5,120	0	0
Jeffery & Pritchard	5,063	0	0
Espley (accepted)	4,976	0	0

For the erection of new offices, for Messrs. Robert Co., Perseverance Iron Works, Lincoln. Mr. W. Wat kins, architect. Quantities supplied:—

Styles	£1,385	0	0
Fotherby	1,226	0	0
Wallis & Son	1,175	0	0
Singsby	1,160	0	0
Taylor	1,156	0	0
Barker	1,149	0	0
Reeve	1,144	0	0
Huddleston (accepted)	1,110	0	0

For Free Methodist Chapel, Normanby-by-Spital Lincolnshire. Mr. W. Watkins, architect. Quantities supplied:—

Kendall	£901	0	0
Freeman	890	0	0
Hunter	807	0	0
Reeve	779	0	0
King & Styles	751	7	0
Mace & Smith	714	0	0
Tye & Richardson (accepted)	660	13	6

For County Police Station, Sittingbourne. Mr. Martin Bulmer, county surveyor. Quantities supplied by Mr. G Ruck:—

Cushing	£3,350	0	0
Spicer	3,000	0	0
Miller	2,830	0	0
Shrubsole	2,755	0	0
Bonnett	2,753	0	0
Wallis & Clements	2,730	0	0
Naylar & Son	2,693	0	0
Jennings (accepted)	2,370	0	0

For the erection of house and shop and alteration o adjoining premises at Eastgate, Rochester, for Mr. J. A Edwards. Mr. J. H. Andrews, surveyor:—

Kemp	£700	0	0
Jennings	609	0	0
Sollett	590	0	0
Lilley & Son	580	0	0
Hopper (accepted)	578	10	0

For the erection of nine cottages at Strood, includin the old materials of cottages, &c., for Mr. J. L. Ed wards. Mr. J. H. Andrews, surveyor:—

Couchman (accepted)	£650	0	0

For the erection of three cottages at Strood, for Mr. J Elvey. Mr. J. H. Andrews, surveyor. Bricks, lime, an sand provided:—

Jennings	£238	0	0
Lilley & Son	284	0	0
Hopper (accepted)	270	0	0

TO ARCHITECTS &c.
PERSPECTIVES Outlined and Coloured, and Geometrical and Detail DRAWINGS prepared from rough sketches or designed by the Advertiser. Address by letter, to ARCHITECT, 20 Gloucester-street, Gloucester-gate, Regent's Park.

ARCHITECTURAL PARTNERSHIP.—The Advertiser, an Architect of increasing practice, but whose connexion is divided, would be glad to CONTRACT into PARTNERSHIP with an ARCHITECT in the metropolis who would be a Partner and would assist to increase his business; or by meeting a Young Architect about to commence business, with good connexion in or near London. Application to be made, by letter only, to G. H. G. Esq. Office of "The Builder."

TO BUILDERS AND OTHERS.
PARTNERSHIP.—WANTED, by the Advertiser, a PARTNER, with a fair capital, to assist in working an old established and lucrative Building Business in the country, which has been successfully carried on for many years past.—For further particulars, apply to F. J. Saw-mills, Manor-street, Chelsea.

PARTNERSHIP.—BUILDERS and OTHERS.—This Advertisement offers a great advantage to a London Builder of moderate Capital, who would be introduced into a first-class CONNEXION of Resident Gentlemen of the neighbourhood. The BUSINESS now belongs to a very old established Plumber and Decorator, occasionally taking the general repairs, situate a few miles out of London.—Apply by letter, name and address, P. O. Order Office, Tooley-street, London Bridge.

BOROUGH of BRADFORD.—WANTED, in the Office of the Waterworks Manager, a Person fully competent to take charge of the Waterworks Books, Plans, and Documents, to act under the direction of the Manager, and to attend to the keeping of accounts, and to all matters connected with the supply of water in the Borough. No one who has not had experience of similar work need apply. Salary, 80l. per annum.—Applications, stating age and present occupation, with testimonials, to be forwarded to me on or before TUESDAY, the 8th of NOVEMBER next.
CHAS. GOTT, Borough Surveyor and Waterworks Manager.
Bradford, October 25th, 1864.

TO PAINTERS.
GOOD WORKMEN TAKEN ON, at 12 & 13, Barmondsey-wall, for a short period

WANTED, in a provincial Architect's Office, an experienced ASSISTANT not less than thirty years of age, and well capable of taking charge of an office.—Address, stating age, copies of testimonials, and salary required, C. V. Office of "The Builder."

TO JOURNEYMEN CARPENTERS
WANTED, an experienced JOBBING HAND.—Apply, by letter, addressed W. G. 17, Montpelier-street, Brompton.

DAVID JONES, BRIDGE IRON-WORKS, and HERBERT'S PARK IRONWORKS, Bilston, Staffordshire, Manufacturer, under License of the Patentee, of
MALLET'S PATENT BUCKLED IRON PLATES,
for Flooring, for Railway and other Bridges, Viaducts, Wharfs, &c. and for the Flooring and other parts of Fire-proof Buildings, and various important structural uses. These plates form the lightest, strongest, most rigid, and durable flooring known. They were pronounced by the late Mr. Brunel, "the best bridge flooring extant." They have been adopted at the New Bridge, Westminster, on the Indian Railways, and in many other first class structures, by Messrs. Fape, Hawkshaw, Randell, Stephenson, and other Engineers; and for Fire-proof Buildings by Government, the War-office, Metropolitan Board of Works, and other important uses.—Application for Ichnographic circulars, prices, and other information as to supply of the Plates, to be made to the Manufacturers as above, or to ROBERT MALLET, Esq. C.E. the Patentee, 11, Bridge-street, Westminster.
N.B.—Manufacturer of Boiler Plates, Bridge and Ship Plates, also Sheet Iron of all kinds, and Rivet Iron of first quality.—Address, BRIDGE IRON WORKS, Bilston, Staffordshire

SMOKY CHIMNEYS,
S. DEACON
Respectfully invites the attention of Architects Builders, &c. to his
PATENT LOUVRE CHIMNEY CAP,
which has been in use some time with perfect success, many curing chimneys where other caps have been of no avail.
The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of misplacing it; an increased up current, and the impossibility of a down one.
Prospectus, with testimonials, forwarded on receipt of Postage Stamp, by
S. DEACON,
59, ALMA STREET, HOXTON, N.
MANUFACTORY:
HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, LONDON, N.

TO IRONMONGERS AND THE TRADE GENERALLY.

The ONLY MEDAL "for STONEWARE"
has been awarded to DOULTON & WATTS, LAMBETH POTTERY, LONDON.
In expectation of a greatly increased sale, D. & W. have determined to introduce the annexed pattern of their ENAMELLED STONEWARE CLOSET-PANS, at the price of the commonest description of earthenware.
Experience has shown that this shape is the most simple and efficient and that in strength, durability, and cleanliness it cannot be surpassed by the most expensive closets.

WORKS, LONDON and BIRMINGHAM.
MANUFACTORY and CITY SHOW ROOMS, 147, HOUNDSDITCH.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London Atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. Whether it under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

SALES BY AUCTION.

CLAPTON PARK ESTATE, Lower Clapton, Middlesex.—Eligible FREEHOLD BUILDING LAND, Land tax and Tithe free.

MR. J. TAYLOR is instructed to SELL by AUCTION, at GARRAWAY'S Coffee-house, Change alley, Cornhill, on MONDAY, NOVEMBER 7th, at TWELVE for ONE o'clock, 80 Lots of FREEHOLD BUILDING LAND, in Clapton-road, near to St. John's Church, Hackney, suitable for the erection of Cottages. Nine-tenths of the purchase-money may remain on mortgage or contract at 5 per cent. interest, to be paid in nine years by equal half-yearly instalments; but the whole or any part of the Balance may be paid off at any time without notice.—Particulars and conditions of Sale may be obtained of T. W. ROGERS, Esq. Solicitor, No. 70, Fenchurch-street; at the Tontine Tavern, Clapton; of Messrs. HAMMACK & LAMBERT, No 59, Bishopsgate-street Within; at the Place of Sale; and of the Auctioneer, No 70, Fenchurch-street, City.

LLOYD'S MARBLE WHARF, PIMLICO.—To Sculptors, Masons, and Others

A SALE of MARBLE by AUCTION will take place at the above Wharf, by order of Messrs. Lloyd, on TUESDAY, NOVEMBER 1st, at ELEVEN for TWELVE, consisting of a large assortment of Marble, in Blocks and Slabs, viz. vein statuary, Sicilian, emperor's red, dove, black and gold, Dardilla, and other marbles: also about 1000 feet of slab, in nearly all the above varieties. Approved bills of four and six months. May be viewed two days previously, and catalogues had at the Place of Sale, No. 1, Grosvenor road, adjoining Vauxhall Bridge

100 Italian and English Marble Chimney-pieces, some of noble proportions and carved by foreign artists; Monuments, Fonts, Columns, Register Stoves, with ornamental bright steel fronts, and a selected importation of Sculpture in Carrara Marble.

MR. JAMES ROBINS (lately of the Piazza, Covent-garden), will SELL by AUCTION, at 465a, NEW OXFORD STREET, on WEDNESDAY next, NOVEMBER 2nd, at TWELVE, ONE HUNDRED MARBLE CHIMNEY-PIECES, some of considerable beauty and less athan proportions adapted for clubs, banking houses, and Hotels, drawing and dining rooms, boudoirs, libraries, ban queting halls, and bed-rooms, also register stoves and Italian sculpture — Now on view. Catalogues of Mr. JAMES ROBINS, Auctioneer, Valuer, Land and House Agent, 5, Chancery-lane, W.C. (Fleet-street end).

SUNNINGDALE, BERKS.—A very valuable Freehold Estate, comprising about 185 acres of Building Land, arranged in convenient plots for the erection of first class villa residences.

MESSRS. DRIVER & CO. have received instructions to SELL by AUCTION, at the GUILDHALL COFFEE HOUSE, London, on MONDAY next, OCTOBER 31, at ONE o'clock precisely, in Eighteen Lots, some very valuable and desirable FREEHOLD BUILDING LAND, containing, together, about 185 acres, situate at Sunningdale, only about six miles from Staines and Egham, within a few minutes' walk of the Sunningdale Railway Station (which adjoins the estate), and is within an hour's ride of London. The lots are well timbered, beautifully undulated, and embellished with ornamental plantations, commanding from every point various and extensive views of the surrounding scenery, so justly celebrated for its picturesque and lovely character. Its close proximity to Virginia Water, Windsor Great Park and Forest, Bagshot Forest, and Ascot Racecourse, and the great diversity of walks and drives in the immediate neighbourhood, render this property unrivalled in its adaptability for the erection of first class villa residences. The drive to Windsor is between five and six miles through the parks by different routes, amidst some of the finest wooded scenery in the kingdom. The dry and healthy nature of the soil and air, the facilities afforded by the existence of good hard roads to all objects of attraction in the vicinity, its proximity to London, the advantages secured to contiguous residents by a reduction of the annual rate of season tickets, and the advantageous manner in which it is proposed to lay out the new road over the estate, afford peculiar advantages for building purposes. It is intended to form a new road through the property, commencing at the bridge of the high road, near which stands the principal lodge and gates of Sir Charles Crossley's estate, and which property immediately adjoins the Sunningdale and Belle Vue domains. Printed particulars, with plans, may be obtained of Messrs. EVERITT & LEWIS, 18, Tokenhouse yard, E.C.; of Messrs. JANSON, ROBB, & PEARSON, Solicitors, 4, Bainchall-street, E.C.; at the Estate Exchange, Change-alley, Cornhill, E.C.; at the Guildhall Coffee-house, Gresham-street, E.C.; and of Messrs. DRIVER & CO. Surveyors, Land Agents, and Auctioneers, 4, Whitehall, London, S.W.

ISLE of WIGHT.—Desirable Freehold Estate, called Wroxall Cottage, and Lot 2, delightfully situate, in the parish of Newchurch, close to the village of Wroxhall and Appuldercombe, only two miles from Ventnor, eight from Newport, and five from Sandown; containing about 61 acres of productive arable and grass land, with cottages and buildings, with the right of pasturage for 100 sheep on Wroxall Down; partly let and partly in hand: the whole being of the rental value of about £160 per annum.

MESSRS. DRIVER & CO. will SELL by AUCTION, at the GUILDHALL COFFEE-HOUSE, London, on MONDAY next OCTOBER 31st, at ONE o'clock precisely, in One Lot, the above valuable FREEHOLD ESTATE—particulars and plans may be obtained at the chief Hotels at Ventnor, Newport, Cowes, Ryde, Southampton, and Portsmouth; on the Premises; at the Estate Exchange, Change-alley, Cornhill; at the Guildhall Coffee-house; of Messrs. FRESHFIELDS & NEWMAN, Solicitors, Bank-buildings, City; of H. J. BECKINGSALE, Esq. and JAMES ELDRIDGE, Esq. Solicitors, Newport, Isle of Wight; and of Messrs. DRIVER & CO. Surveyors, Land Agents, and Auctioneers, No. 4, Whitehall, London, S.W.

EARLY SALE. Nearly 400 Lots.—CAMDEN TOWN, near the Old Eagle Tavern and Railway Station.

MESSRS. LEREW will SELL by AUCTION, on the PREMISES, Camden-terrace, on MONDAY OCTOBER 31st, at ELEVEN for TWELVE 18 loads WHITE FIR BALK, 1,500 planks, deals, and battens, 2,000 feet mahogany, 1,000 feet pencil cedar, 1,000 feet walnut, 1,000 feet wide pine, 100 squares flooring, mouldings, doors, cut stuff, quartering, scaffold-poles, cistern, chimney-pieces, paving, four capital ovens, and a quantity of useful old materials.—Auction-offices, Cardington-street, Hampstead-road.

LEASEHOLD MANUFACTURING PREMISES, Great Garden-street, Whitechapel; with Possession

MESSRS. FULLER & HORSEY are instructed by Mrs. Glasscott, who is relinquishing business, to SELL, by AUCTION, on TUESDAY, NOVEMBER 8th, 1864, at TWELVE o'clock precisely, on the PREMISES, the LEASEHOLD INTEREST in spacious Manufacturing Premises occupying a very large area, and arranged as a Brass Foundry, Turnery, Smith's Shop, Yard, Shop, and two Dwelling Houses, situate Nos. 4 and 5 Great Garden street, Whitechapel. The whole is held on Lease for a term of years, at £52 per annum. Immediate possession may be had To be viewed by the side.—Particulars may be had, in the Premises; of ALFRED TURNER, Esq. Solicitor, 15, Great Alie street, Whitechapel; and of Messrs. FULLER & HORSEY, 13, Billiter-street, Fenchurch-street, E.C.

TO BRASSFOUNDERS, ENGINEERS, AND OTHERS.

MESSRS. FULLER & HORSEY are instructed by Mrs Glasscott, who is relinquishing business, to SELL by AUCTION, on TUESDAY, NOVEMBER 8th, at ELEVEN o'clock, on the PREMISES, Great Garden-street, Whitechapel, in lots, the PLANT and IMPLEMENTS of a BRASS-FOUNDER; consisting of air furnace, two pit furnaces, seven melting and one brass-making machines, moulding trough and boxes, a winch, self-acting screw-cutting lathe, 10 gas lamps, lifting tackle, 6-inch cylinder, 10-inch power steam-engine, by Stewart, with Cornish boiler; edge runner, bell-filter, sugar mill and sugar pan, metal and wood patterns, three-light Church brass, nine four-light ditto, counter, desks, stools, vices and benches, scales and weights, pony-cart and harness, truck, iron safe, and numerous other lots. To be viewed on MONDAY preceding the Sale, when catalogues may be had on the Premises; and of Messrs. FULLER & HORSEY, 13, Billiter-street, Fenchurch-street, E.C.

TO BUILDERS AND OTHERS.—100,000 BEST SLATES.

HAKES & SHAKELL are instructed by Mr. William Proctor, Contractor, to SELL the whole of the above Property by AUCTION, on the PREMISES, Grafton Mews, in the rear of No. 2, Prince Wales Road, Kentish-town, N.W. and in a Field at the rear of Wolsey-terrace, Kentish-town, N.W. on TUESDAY, the 8th of NOVEMBER, 1864, at TWELVE o'clock to the minute. Catalogues ready four days prior to the Sale, to be had of HAKES & SHAKELL, Auctioneers and Valuers, 71, Park-street, Camden-town.

TWICKENHAM PARK, near RICHMOND.—Most Eligible BUILDING LAND TO BE LET on Lease, for Ninety-nine Years, in Large or Small Plots. Money advanced, if required.—For particulars, apply to W. BACKHOUSE, at the Estate Offices, Twickenham Park; or EDWARD GUILLAUME, Esq. 14, George-street, Manaion House, London.

SURBITON.—To BUILDERS and OTHERS.—LAND TO BE LET, on building leases, five minutes' walk from the station, and close to the river, for houses of not less than 80l. a year rent. A portion of the money will be advanced if required.—Apply to Mr. MUDIE, Victoria-road, Surbiton.

A FREEHOLD MANSION TO BE SOLD. The elegant Furniture may be had at a valuation There are four reception-rooms, two being 26 feet in length; eleven best bedrooms; stabling for eight horses and coach-house for four carriages; suitable servants' offices; extensive ornamental grounds, with greenhouses, in all 28 acres; gravelly soil; near Sunningdale Station, South-Western Railway, half a mile from Windsor Great Park, and fifty minutes from the Waterloo Station.—Apply to J. BOWEN MAY, Esq. Solicitor, 67, Russell-square.

WATERSIDE PREMISES, City-road.—Messrs. FULLER & HORSEY are instructed to LET, on LEASE, from Michaelmas next, extensive WATERSIDE PREMISES, occupying a site of 21,000 superficial feet, situate on the Wenlock Basin, City-road, and comprising a spacious and substantial modern brick built manufactory of two floors, engine and boiler houses, with 50 horse power steam engine and three Cornish boilers, range of lofty brick offices, workshops, and warehouses with gateway entrance. There is a water frontage of about 207 feet.—For further particulars, apply to Messrs. FULLER & HORSEY, 13, Billiter-street, London, E.C.

BROWNSWOOD PARK, Green Lanes, Stoke Newington.—BUILDING LAND on the above Estate TO BE LET, for 96 years, at 4s per foot, for the Erection of Houses about 40l per annum. Good roads and sewers. Brick on the estate advanced cheap.—Apply to Mr J B PORTER, 8, Brownswood Park.

CITY WAREHOUSE.—WANTED, a large AREA in the Neighbourhood of St. Paul's, St. Martin's-le Grand, or Newgate-street; or Property which could be converted for building.—Apply by letter, stating particulars and terms, to Messrs. EDWARDS & JAMES, 18, King-street, Cheapside, E.C.

KING-STREET and GRESHAM-STREET, CITY.—FOR SALE, by PRIVATE CONTRACT, an exceedingly valuable and important LEASEHOLD PROPERTY, Nos. 18 and 19, Gresham street, and 18, King-street, in the heart of the City; comprising a modern substantial Stone Building, of handsome elevation, occupying an area of about 3,000 square feet, and occupied as first-class offices: term, 88 years; ground-rent, 400l. Possession can be had of part immediately, and of the remainder at early periods. Particulars may be had of Messrs. NEVE, WILSON, & FARRAR, Solicitors, Cranbrook, Kent; or of Messrs. NORTON, HOGGART, & TRIST, Auctioneers, &c. 62, Old Broad-street, London.

BUILDING SITE, close to High-street, Borough, suitable for the erection of warehouses or manufactories, premises TO BE LET or SOLD, with immediate possession, a CORNER PLOT of GROUND, having a double frontage of about 250 feet, and a depth of about 106 feet; in all about 14,950 feet superficial Plan may be seen and particulars had, at the Offices of Mr RICHARD ROBERTS, 30, Laurence Pountney-lane, Cannon-street.

PREMISES.—Very valuable PREMISES, situate in a main and populous neighbourhood, one mile north of the Bank, containing about 4,000 feet in all, with large yards and lately occupied by a timber merchant, who realised a large fortune therein. The great scarcity of premises, owing to the increase of railways in the metropolis, render these peculiarly adapted for the wants of any one requiring large and central, valuable space.—Apply to E. & W. STUEGE, Bridge Wharf, City-road, E.C.

WELLINGTON COLLEGE LANDS, near Wokingham, with a Station on the spot, and bounded by excellent roads—TO BE LET for BUILDING detached or semi-detached VILLAS, certain portions of LAND on long Leases, and at moderate ground rents.—The situation is particularly desirable and healthy. Occupiers of Villas will enjoy certain privileges in connexion with the College. For further particulars, apply by letter, to GEORGE CHANCE, Esq. Treasury, Whitehall, S.W.

NO MONEY REQUIRED.—To BUILDERS.—WANTED, to EXCHANGE, the fee Frontage to Tollfree-terrace, of FREEHOLD LAND, in the Westwood, Plumstead Hill, Kent, for the FINISHING of a Small HOUSE, in Carcase, and the Erection of a similar one complete, 24 feet iron stage, street deep, by 22 feet elevation.—Apply personally, after SIX o'clock p.m. to Mr BENNICK, Carpenter, Kyd's, Tudor road, Upper Norwood.

FARRINGDON-STREET, near the Metropolitan and Dover and Chatham Railway Stations.—TO BE LET, on Building Leases, the PREMISES Nos. 13, 14, and 15, Bear-alley, the Committee of Parish Estates will meet in the Vestry-room of the Church of St. Sepulchre, Skinner-street, Snow-hill, on FRIDAY, NOVEMBER 4th next, at TWELVE o'clock precisely, to receive TENDERS. Parties intending to treat are themselves to inspect the premises, or any Tender. Other particulars may be known upon application to Mr. STEP. JNO. JONES, Vestry Clerk, 1 Church-porch, Skinner-street.

TO CAPITALISTS and BUILDERS.—WANTED, a HOUSE to be BUILT, near the Staff College, Surrey. Rent about 50l per annum, including ground rent, which is moderate. A tenant is willing to take the house as soon as it is ready for occupation, if built according to plans approved by him.—Apply to Capt. SCHAW, R.E. Staff College, Farnborough Station.

TO BUILDERS and OTHERS.—A great demand having arisen in Loughborough for Middle-class HOUSES, the Trustees of Burton's Charity are prepared to apply to the Court of Chancery for a premium TO LET on BUILDING LEASE, some of the Charity LAND in the immediate vicinity of the town. The Land which they propose to Let commands extensive views Charnwood Forest, is contiguous to the Grammar and Commercial School on the Leicester-road, and from any favourable for the erection of desirable Residences.—Application to be made to Mr. W. J. WOOLLEY, Receiver and Clerk, to Burton's Charity, Loughborough. Loughborough, October 18th, 1864.

TO BUILDERS and OTHERS.—WANTED, to RENT, in a thorough good market or seaport town, with a convenient distance of London, a comfortable DWELLING-HOUSE with spacious premises attached, suitable for carrying on the general business of a builder. The advertiser would not object to take to a fair amount of stock in trade. Unexceptionable references can be given.—Address, stating full particulars, to K. W. 80, Lombard-street London, E.C.

JOHN P. SEDDON, } Hon. Secs.
CHAS. F. HAYWARD, }

NOTICE.—Mr. LUDWIG DENICKE, of Leipzig, has been appointed AGENT to receive Advertisements, and to supply "The BUILDER" in GERMANY AND EASTERN EUROPE.

BILLING'S PATENTS.—CHIMNEY TERMINALS.—THROAT VALVES.—NOTICE to ARCHITECTS.—The Proprietors of the PATENTS have given the Widow in Interest in the same, and have consequently received Notice of the Article, trusting that by so doing these useful Inventions may be introduced to the notice of all new buildings.—Prices, apply to the Manager, Mr. TYLER, 12, Aldersgate-street, Manchester, who will also afford any information, he having been for many years engaged with the late Mr. BILLING, in the practical curing of Smoky Chimneys.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72–74, Bishopsgate street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Large Media Ranges and Stoves, Cooking Utensils, &c. to meet the great public demand; and also for the consequent more extensive exhibition of all descriptions of hot water, bath, fire-irons, and stove work.

72–74, Bishopsgate street Within.

FULFORD CHURCH, near York.—The Selection of DESIGNS sent in for the NEW CHURCH, are undergoing careful consideration, and cannot be returned for another fortnight. Beckton Grove, near York.

CONTRACTS.

TO BUILDERS.—Persons desirous of TENDERING for the ERECTION of NEW BANKING PREMISES, for Messrs. Sparrow & Co. at Ryde, Isle of Wight, can inspect the Plans and specification, at my Office, Cleveland-street, for the last of which Five Guineas will be paid. Sealed Tenders will be received by me before TWELVE o'clock on the 15th day of the Month of NOVEMBER. The lowest or any Tender will not necessarily be accepted. CHARLES HENRY LLOYD, Architect.

Pickett's Hall, Old Broad street, London, and Cleveland-street, Ryde.

WEST HAM LOCAL BOARD of HEALTH.—Notice is hereby given, that the Board of Health for the District of West Ham in the county of Essex, are prepared to receive TENDERS for WIDENING the APPROACHES to the Iron Bridge on the Angle-road, over the Great Eastern Railway. Copies of the contract, forms of Tender, and any further information, may be obtained at the Office of the Local Surveyor, at 11, Romford-road, E. Tenders are to be delivered at my Office, at Bonny House, to arrive not later than MONDAY, the 7th NOVEMBER next, to one of them to be given a deposit book of Engineer's or other Tenders, and to be returned on receipt of the Tenders for the purpose of the contract and bond by sureties, if required.

By order of the Board,
CHARLES WILSON, Clerk.

Rokeby House, Stratford, E. October 11, 1864.

TO BUILDERS.—Persons desirous of TENDERING for the ERECTION of a WALL [illegible] by 70 feet, and a Gate, at Wanstead, in the county of Essex, for the Rt. Hon. [illegible], are invited to attend at the Office of Mr. [illegible], on [illegible] next, and addressed to me, to be delivered at the Office of Messrs. [illegible], on or before the 9th day of NOVEMBER next, when I am instructed to accept the lowest or any Tender.

THOS. ST. PEEL, Architect.

[illegible] Street, Waltham Cross.

MIDDLESEX COUNTY LUNATIC ASYLUM, COLNEY HATCH.—NOTICE is hereby given, that the Visiting Committee will meet at the Asylum, on WEDNESDAY, the 9th day of NOVEMBER next, at TWELVE o'clock precisely, for the purpose of opening Tenders for the Supply of the Asylum with Coals, Coke, Flour, Bread, Meat, Groceries, Potatoes, Provisions, Forage, and Sundries, and for letting the Stewardship of the Asylum Farm, for one year from Lady-day next; and Tenders must be sent in by MONDAY, the 7th of NOVEMBER next.

CONTRACTS.

CROYDON WATER WORKS.—To ENGINEERS.—CONTRACT No. 1.—Notice is hereby given, that the Croydon Local Board of Health are prepared to receive TENDERS from persons desirous of CONTRACTING with them for the CONSTRUCTION and setting to work of a Single-acting CORNISH PUMPING ENGINE, in accordance with a specification prepared by Mr. BALDWIN LATHAM, C.E. their Engineer. Such specification may be seen in the said Engineer's Office, in the Town-hall, Croydon, on or after TUESDAY, the 1st day of NOVEMBER next. Sealed Tenders, endorsed "Tender for New Steam Engine" are to be delivered at the Office of the Local Board, in the Town-hall, Croydon, on or before FOUR o'clock in the afternoon of TUESDAY, the 15th of NOVEMBER. The Local Board do not bind themselves to accept the lowest or any Tender.

HENRY RICHARDS, Clerk to the Board.

Croydon, November 2nd, 1864.

CROYDON WATER WORKS.—CONTRACT No. 2.—Persons desirous of CONTRACTING with the Croydon Local Board of Health for the CONSTRUCTION of THREE SINGLE-FLUED CORNISH BOILERS, in accordance with the plans and specification prepared by Mr. BALDWIN LATHAM, C.E. the Engineer for the Local Board, can inspect such plans and specification at the Office of the said Engineer, in the Town Hall, Croydon, on or after this date. Sealed Tenders, endorsed "Tender for Boilers," are to be delivered at the Board Offices in the Town Hall, on or before FOUR o'clock on the afternoon of TUESDAY, the 22nd day of NOVEMBER instant. The Local Board do not bind themselves to accept the lowest or any Tender.

HENRY RICHARDS, Clerk to the Board.

Croydon, November 2nd, 1864.

Trinity House, London, E.C. 20th October, 1864.

TO ENGINEERS and OTHERS.—This Corporation being desirous of obtaining TENDERS for the ERECTION of a WROUGHT-IRON PILE LIGHTHOUSE on the Sand-head at Lowestoft, near the Harbour of Refuge, hereby give Notice that the plans, specifications, forms of Tender, and conditions of contract are deposited at this House, and may be inspected on any day between the hours of TEN o'clock a.m. and FOUR p.m.

Tenders must be delivered at this House on or before MONDAY, the 21st of NOVEMBER next, addressed to the Secretary, and marked "Tender for Lighthouse," and no Tender will be entertained that is not made on the forms provided.

The Corporation do not pledge themselves to accept the lowest or any Tender.

By order of the Corporation,
P. H. BERTHON, Secretary.

PARISH of BRIGHTON.—To BUILDERS and OTHERS.—The Directors and Guardians of the Parish of Brighton are desirous of receiving TENDERS from persons willing to Contract for the ERECTION of a WORKHOUSE, upon land adjoining the Union Farm, near Sand-hills, Lewes-road, in the said Parish, agreeably to drawings and specification prepared for that purpose. The drawings, specification, and conditions of contract may be inspected at the Directors' Room, at the Union Offices, Bartholomew-street, Brighton, on any day (except Sunday), between the hours of TEN a.m. and FOUR p.m. Copies of the bills of quantities and forms of Tender may be obtained on application at the Offices, on and after MONDAY next, at the above Offices, and also of Messrs. LANSDOWN, 3, Warwick-street, Charing-cross, London, on payment of the sum of Two Guineas, which will be returned to all persons who shall tender for the execution of the work. Tenders, indorsed "Tender for the Erection of Workhouse," to be delivered at the Office of the Clerk to the Directors and Guardians, Carlton-street, Brighton, on or before TUESDAY, the 15th day of NOVEMBER next, by TWO o'clock in the afternoon. Each Tender to be accompanied by a proper security to be approved for the approval of the Directors and Guardians of the said Parish and addresses of two persons who are willing to become the proposed bail for the due performance of the work. The Directors and Guardians will not find themselves bound to accept the lowest or any Tender, and they do not bind themselves to pay the expenses of any person tendering.

By order of the Board,
ALFRED MORRIS, Clerk.

Parochial Office, Brighton, 24th October, 1864.

TO BUILDERS.—BUNHILL ROW.—TENDERS are required for sundry ALTERATIONS, ADDITIONS, and REPAIRS to Nos. 114 and 115, ST. LUKE'S ROW, and No. 5 and 6, JAMES BUILDINGS, in the same. The drawings, specifications, and forms of Tender may be seen at Mr. Hickman's, on and after THURSDAY next, the 10th instant. The lowest or any Tender will not necessarily be accepted.

TO BUILDERS.—Persons desirous of TENDERING for the REBUILDING of ST. HELEN'S CHURCH, Bishopsgate, may see the plans and specifications at Mr. EDWARDS' Bee-saver, Leadl, Lowestoft, Suffolk, to be sent in before NOVEMBER 26th, to the Rev. L. D. KENNEDY, the Rector. The lowest Tender not necessarily accepted.

The Owner; and see Specimen at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect oolite) is raised in blocks of any portable size, and is about 4 feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.
*** The above WEATHER STONE is used largely by London Builders.

W. & J. FREEMAN, Merchants in the various descriptions of STONE, GRANITE, and SLATE, for Engineering and Building Purposes. Supplies direct from the Quarries, by vessel or railway. Direct communication with the principal ports for EXPORTATION. Wharf prices and estimates for special contracts, including quarry work or other labour, forwarded on application.—Office, 27, Millbank-street, London, S.W.

TO PAINTERS and GENERAL DECORATORS.—TO BE SOLD, in consequence of the death of the proprietor, a small old-established BUSINESS of a PAINTER and GENERAL DECORATOR, situate in one of the best thoroughfares in the Metropolis, including the Lease and Utensils.—For particulars and terms, apply to Mr. J. H. JONES, Solicitor, 8, Hart-street, Bloomsbury-square.

TO BE LET, a good JOBBING BUILDER and UNDERTAKER'S BUSINESS, with immediate possession, with good House and Premises, at a low rental of 25l. per annum, to be taken at a premium of about 200l.—Address, W. M. Office of "The Builder."

TO BUILDERS.—Rare Opportunity for a Man of Business.—TO BE LET, on lease, or FOR SALE, a BUILDING BUSINESS, with dwelling-house, shops, office, sheds, yard, and every convenience, and a good commanding trade. An opportunity now offers for introducing a spirited builder into a largely increasing business, in a good country market town, rapidly rising with manufactories, with land just about to be sold for building purposes. The advantage of a railway station close to the establishment. The business is offered solely because the owner has another business that fully occupies his time.—Further particulars may be obtained on application, per post, to Mr. NOAKE, Sherborne, Dorset.

PRIZE WAGGONS and CARTS.—HAYES & SON,
Manufacturers to Her Majesty's Board of Ordnance, and all the principal Railways in the Kingdom,
Coach and Cart Wheelwrights, Spring Van and Waggon Builders, Timber Merchants, Contractors, &c.

Sole Makers in London—
HAYWARD TYLER & CO.
Nos. 84 and 85, Upper Whitecross-street, E.C.

BROWN BROTHERS' PATENT KITCHEN RANGES,

WITH SELF-ACTING ROASTER,

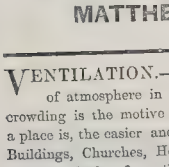
Accomplish twice the amount of cookery performed by any other kitchener of similar size, and with half the amount of fuel. They will bake the most delicate pastry even when all others have failed, and roast the meat with a crispness and delicacy of flavour unknown to any other apparatus. They are the smallest kitchen ranges ever made, and the most economical in use. Will boil two gallons of water for tea in five minutes, and keep it boiling for hours, and furnish an abundant supply of hot water for the Bath, Closet, Lavatory, &c. They require no flue, and can be fixed in any room, and connected with the ordinary chimney-pipe or brick flue, and combine the cleanliness of a close kitchener with the perfect ventilation of an open fire.

THE PATENT AUTOMATON ROASTER

Revolves of itself, turning briskly on being placed in front of the fire, and is considered by thousands who have used it to be superior to both roasting methods in common use, viz. the screw jack and the hand. Boilers and ovens are also well adapted for Private houses, Villas, &c., at very moderate cost, as large Wrought-iron Boiler and Oven, specially adapted for Drawing Rooms, Villas, &c., at very moderate cost, as large Wrought-iron Boiler and Oven, specially adapted for Drawing Rooms, Villas, &c., at very moderate cost.

BROWN BROTHERS' ONLY LONDON DEPOT, 43 CRANBOURN-ST., W.C.

Exhibition Medal. Catalogues and Designs post-free. Prices from £2 8s. to 200 Guineas.



N.B.—BROWN BROTHERS establishe[illegible] wards of 15 years are connected with no firm of [illegible] name.

"A form of Range, which, with Apparatus in connection with it, deserves particular attention."—"BUILDER," October 11, 1862.

Orders requiring Despatch and Punctuality can be executed in a few days.

VENTILATION.—OVERCROWDING.—Boyle's System of Natural Ventilation ensures even a more healthy condition of atmosphere in overcrowded places than is usually present in thinly-inhabited or empty places. The heat arising from the state of overcrowding is the motive power which works this system with infallible regularity and effect. The smaller, closer, hotter, and more overcrowded a place is, the easier and better can it be ventilated on this system. It is applicable to all places alike, Cottages, Mansions, Public Halls and Buildings, Churches, Hospitals, Factories, Work-rooms, Stables, Cow-houses, Conservatories, and even Mines and Ships. Let no one form a hasty conclusion from the seeming extravagance of this statement. It is a far wiser plan to examine first and conclude afterwards. "*In one instance under our own eye Mr. Boyle has operated very successfully.*" —Article, "Air in the Corners," *Builder*, 15th October, 1864. THOS. BOYLE, 23, Little St. Andrew-street, Upper St. Martin's-lane, London. Agents, Messrs. COMYN, CHING, & CO., at same address.

PRIZE MEDAL, 1862.

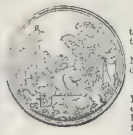
NUT PLATE.



We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, [illegible] improvements having been recently made in it. It has been extensively used in Public and Private Buildings, in Her Majesty's Patent and Car Patent sheet value, many hundred sets without one single failure. It is applicable to all Locks and Latches, both Rim and Mortise, and effects a most secure fastening, without any screw in the neck of the knob. Perfection guaranteed both Locks and Furniture, of the Locks are of our own manufacture.
New rich Designs in Glass, China, Brass, Bronzed, Gilt, Carved Woods, Inlaid, &c. &c. or to any Design.
THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.
A most complete and extensive stock of every description of Locks, Latch Brass Foundry, and Ironmongery, required for Buildings, of the best quality manufactured, at the lowest wholesale prices.
, Illustrations and Particulars sent on application.
WAREHOUSES FOR NAILS, PIPES, GUTTERS, &c. IN ST. JOHN'S COURT.

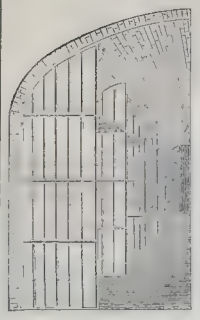
A LARGE STOCK of the PATENT HINGES kept ready for delivery, consisting of Door-springs, Gate-hinges, Rising-hinges, Rising Spring-hinges, Non-rising-spring-hinges, Double-acting Spring-hinges Rising and Noiseless Door Rack-springs, &c.
Price List and Drawings on application as above.

STEAM-ENGINES FOR SALE.—CLERIHEW & LASCELLES, Finsbury Steam Joinery Works, Bunhill-row, will shortly have a first-class Portable 6-Horse ENGINE, by Tuxford, to dispose of. At present used for deep cutting deals and planks. Also, a highly finished Double Cylinder OSCILLATING ENGINE, of 12-Horse Power, with a 16-foot Cornish Boiler for ditto. At present in use driving a variety of machines. The above Engines, which are to be exchanged for a larger one, may be seen at work, and further particulars obtained, on application as above.

BUILDINGS AND SHIPS EFFECTUALLY SECURED AGAINST LIGHTNING.
PATENT LIGHTNING CONDUCTORS, according to the system of Sir Snow Harris, F.R.S. as now universally adopted in every department of the Public Service, supplied and carefully fitted in every detail, under the immediate instructions of Sir Snow Harris, by J. W. GRAY, who has effectually secured a large number of ships, public buildings, and magazines against the destructive agency of lightning, including the Houses of Parliament, magazines, afloat and on shore, of the War Department, and many churches and other important structures. Buildings surveyed, and plans and estimates submitted, if called for.
J. W. GRAY & SON, 114, Fenchurch-street, E.C.



LIGHTNING CONDUCTORS.
R. S. NEWALL & CO. Patentees of the COPPER ROPE LIGHNING CONDUCTOR, supply the same, with the point and all staples, complete for fixing, at the following prices:—
Three-eighths-inch diameter..... 1s. 6d. per foot.
Half-inch diameter ..... 1s. 9d. „
Five-eighths-inch diameter ..... 2s. 0d. „
R. S. Newall & Co.'s Patent Copper Rope Lightning Conductor is being supplied by architects, engineers, and scientific men, in all parts of the world.
Offices 150, Strand, London.
„ Gate-head-on-Tyne
„ 27, Dale-street, Manchester.
„ 66, Anderston-quay, Glasgow.
„ 17, South Castle-street, Liverpool
„ Ex Change Buildings, Dundee.

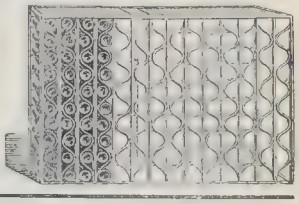
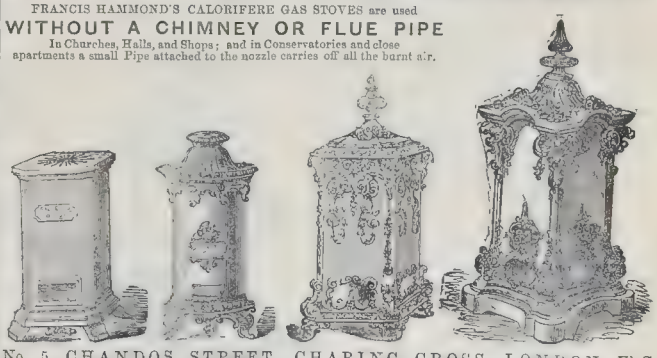
A complete List of which will be forwarded upon application to
FRANCIS BIANCHI (late Blyth & Bianchi),
Nail Manufacturer and General Factor, BIRMINGHAM, and 16, Gresham-street, London, E.C.



WROUGHT IRON WINE BINS.



FARROW & JACKSON
Beg to call the attention of Architects and Builders to their Wrought Iron Wine Bins, which are ADAPTED (as shown) either for BRICK ARCHED VAULTS or CELLARS with FLAT CEILINGS, the mode of fixing in either case being so simple, that they may be put up by any ordinary workman. They combine great strength with lightness and economy of space, and their DURABILITY has been satisfactorily PROVED DURING nearly FORTY YEARS.
The Shelves are formed of Plates of Iron laid on Bars, which rest on the Cross-bars of the Lattice Uprights, and are removable at pleasure.
Plans and Estimates furnished, and Cellars fitted complete in any part of the Kingdom.
*** As these Bins were the invention of the late Mr. FARROW, and great attention has been given to them by the present Firm, long practical experience enables FARROW & JACKSON to offer the best advice as to arrangement.

ALSO THEIR
NEW REGISTERED IRON BINS,
Made any size or shape, to fit any spare corner, with
SEPARATE REST FOR EACH BOTTLE,
Peculiarly adapted for Private Cellars.
No laths are required, and all trouble of Binning is avoided. The Cellular Bins may also be had fitted with light lattice doors, affording perfect security to the contents of the Bin.
FARROW & JACKSON,
18, 17, and 16, GREAT TOWER STREET; and
1, HARP LANE, LONDON, E.C.
FACTORY, 57 and 58, MANSELL STREET.

SMOKY CHIMNEYS,

S. DEACON

Respectfully invites the attention of Architects Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

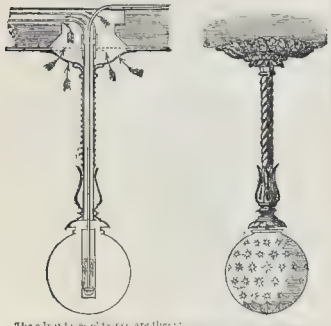
which has been in use some time with perfect success, many curing chimneys where other caps have been of no avail.

The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of misplacing it; an increased up current, and the impossibility of a down coe.

Prospectus, with testimonials, forwarded on receipt of Postage Stamp, by

S. DEACON,

59, ALMA STREET, HOXTON [illegible].



MANUFACTORY:

HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, LONDON, N.

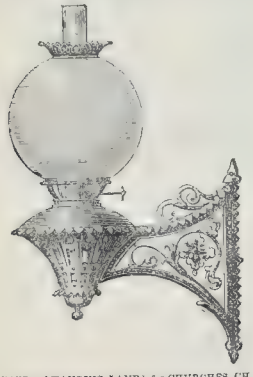
FRANCIS HAMMOND'S

VENTILATING GLOBE LIGHT,

combining an agreeable method of lighting, with convenient, simple, and efficient ventilation.

The advantages of this are these:—

A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION



A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR.

AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.

A GLOBE LIGHT will consume about 7 feet of gas per hour, giving as much light as an ordinary three-light chandelier, with a consumption of 12 feet per hour.

No. 5, CHANDOS STREET, CHARING CROSS, LONDON, W.C.

THE KOH-I-NOOR LAMP, to BURN HYDRO CARBON OILS.

BRACKET and HANGING LAMPS, for CHURCHES, CHAPELS, and PUBLIC BUILDINGS, MANUFACTURED by

JOHN WARNER & SONS,

CRESCENT, CRIPPLEGATE, LONDON, E.C.

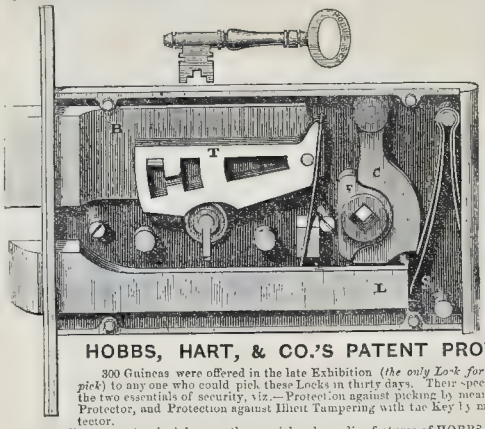
Possess important advantages in Cleanliness for trimming. Coloured Designs forwarded on application.

TO IRONMONGERS, BUILDERS, &c.

PATENT WROUGHT-IRON WELDED TUBE for GAS; Galvanized ditto, for Water; High-pressure Cocks, &c. Manufacturers of Dr. Arnott's Improved Ventilators.

HULETT & CO. 55, High Holborn.

HENDERSON'S PATENT DERRICK CRANE.—Prize Medals for Practical Utility and Moderate Cost.



HENDERSON'S PATENT DERRICK CRANE, so extensively used in the building of the Palmanston Forts, can always be had from the Makers, their Depôt Specimen, Portable, Foundry, Forge, Wharf, Quarry, Warehouse, and other descriptions of Cranes; also Steam Winches and Crabs (for the Derrick given plan). Water Companies and others are [illegible] with our Improved Sluice Valves.—For further particulars apply to BOWSER & CAMERON, Makers, Springfield Iron Works, M'Neil-street, Glasgow.

HOBBS, HART, & CO.'S

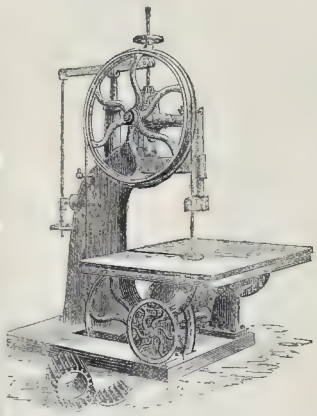
MACHINE-MADE LOCKS AND STREET-DOOR LATCHES.

These Locks are recommended for all purposes requiring good security combined with economy of price and durability of wear, as by means of machinery a faultless accuracy is arrived at, which by hand labour would be impossible except at a greatly increased cost.

Architects and Engineers are requested to notice that the security of these Locks consists in a series of Levers, that have to be raised to unequal positions by the bits of the key before the bolt can pass. These will bear comparison with those at treble their cost.

These Locks are made with from Two to Five Levers, and can also be made in suits to differ with Master Keys to pass.

The retail prices of Locks for Cabinet purposes are from 2s. to 4s. each; for Room Doors, 4s. to 9s. 6d. each; Street Door Latches, 7s. 6d. to 18s. each.



This Illustration represents the Two-bolt Four-lever Mortise, with Hobbs & Co.'s Patent Follower, price 8s.

HOBBS, HART, & CO.'S PATENT PROTECTOR LOCKS.

300 Guineas were offered in the late Exhibition (*the only Lock for which a Premium was offered to pick*) to any one who could pick these Locks in thirty days. Their speciality consists in their combining the two essentials of security, viz.—Protection against picking by means of their Patent Moveable Lever Protector, and Protection against Illicit Tampering with the Key by means of their Patent Nozzle Protector.

These all-important principles are the special and peculiar features of HOBBS, HART, & CO.'S Patent Locks. These Locks vary in price from 10s. to 5l. each, with Solid Keys. For prices, with Changeable Keys, see 16-paged Illustrated List of Locks, Iron Doors, Safes, &c. which can be had on application.

HOBBS, HART, & CO. 76, CHEAPSIDE, LONDON, E.C.

FOR THE SUM OF £6.
Net Prompt Cash.

PRICE LIST ON APPLICATION.

VIEILLE MONTAGNE ZINC.

THE ITALIAN-FORMED ZINC is much approved of by Architects and Engineers on account of its strength, durability, and appearance. On account of the light framing required, roofs, including framework and fixing, can be covered with it FOR £3 PER SQUARE up to 25 feet span. Sheds of larger span, including posts, 4*l.* per square. Architects are cautioned against allowing anything thinner than No. 13 gauge (20 oz.) to be used. ALL PLATES SHOULD BE REJECTED NOT BEARING, in addition to the Company's name, the words "ROOFING ZINC," and the gauge.

OLD ZINC RETAKEN AT HALF THE MARKET PRICE OF NEW.

For Designs and Estimates for Roofs, with Timber or Iron Framework, IRON CHURCHES COVERED WITH ZINC, and Buildings for the Colonies, apply to

THE COMPANY'S SURVEYOR,
12, MANCHESTER BUILDINGS, WESTMINSTER, S.W.

JAMES W. TYLER, CONTRACTOR FOR
DEVAUX'S VIEILLE MONTAGNE THICK ZINC ROOFING,

ON IMPROVED PRINCIPLES.

12, ABINGDON STREET, and 4, WOOD STREET, WESTMINSTER, close to Victoria Tower.

Estimates furnished for every description of Zinc Roofing and Guttering, Inclosure or exclusion of Timber or Iron Framing, in all parts of England.

Having for several years been actively employed in laying DEVAUX'S THICK ROOFING ZINC (the purest extant) upon the new principles introduced by Mr. Edmeston, Mr. TYLER can refer with confidence to work done as his best recommendation.

Good Zinc badly laid will still be a failure, for there is much more importance in the mode of laying than is yet generally known; and parties who will intrust their work to Mr. TYLER will find that this important point is thoroughly attended to, and at no extra cost.

The Zinc thus laid is quite as lasting as lead, if the woodwork is arranged according to Mr. TYLER'S directions.

THE LAND SECURITIES COMPANY
(Limited).

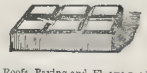
TO BUILDERS AND OTHERS.

THE GENERAL FINANCE, MORTGAGE, and DISCOUNT COMPANY (Limited).
Offices—3, PENTONVILLE ROAD, LONDON.
PETER GRAHAM, Esq. Oxford street, Chairman.
Solicitors,
Messrs. BOULTON & SONS, Northampton-square.



This Company is prepared promptly to negotiate all kinds of Financial Business, including loans on good Personal Security, Advances for terms of years on Mortgage of Freehold and Leasehold Property repayable by instalments; the Discount of good Bills; Advances on Shares, Deposit of Deeds, &c.

The Directors are also prepared to receive Deposits at call or on short notice, for which 6 per cent. will be allowed until further announcement.

E. BALCH, Secretary

GRESHAM LIFE ASSURANCE SOCIETY
No. 37, Old Jewry, London, E.C.
F. ALLAN CURTIS, Actuary and Secretary.

POLONCEAU and SEYSSEL ASPHALTE.

For covering Flat Roofs, Paving and Flooring of every description, especially in places subject to damp and steam. This Asphalte is now extensively used for paving Stables (as shown above), the absence of joints preventing the generation of any kind of vermin. For Estimates and Prices, &c. &c. apply to JOHN PILKINGTON, 25, Fish street-hill, London, E.C.

Country Builders supplied with Asphalte in Bulk for covering Footings, Barn Floors, &c with instructions how to lay it down.

KAMPTULICON FLOOR CLOTH.
For CHURCHES, PUBLIC BUILDINGS, BILLIARD ROOMS, and PRIVATE HOUSES.
GOUGH & BOYCE,
No. 76, CANNON-STREET WEST, E.C.

INDIA-RUBBER MILL BANDS,
WASHERS for STEAM JOINTS, HOSE PIPES, and FLEXIBLE TUBING.
A STOCK OF THE ABOVE ALWAYS ON HAND.
JAMES LYNE HANCOCK,
VULCANIZED INDIA-RUBBER WORKS, GOSWELL MEWS, GOSWELL ROAD (opposite Spencer street), LONDON, E.C.

The Builder.

VOL. XXII.—No. 1135.

*The Steam-boat Piers, and the Landing-stairs, in the Thames Embankment.**

E have already referred to the condition of the execution of the work of the steam-boat piers at Waterloo Bridge,—the foundations being carried down below the footings of the pier of the bridge,—which involves the necessity of securing the foundations of the bridge-pier. The manner in which the important measure is proposed to be effected, is now to be described. The difference of the levels is not very clearly shown; but it may be as much as 6 ft. or 7 ft. Ground about the pier of the bridge, or taking in a breadth from the pier, of 19 ft. or 20 ft. on the river-side, that of the second arch, is to be enclosed by a "permanent dam" of cast-iron piles and plates, attached to the present footings by iron tie-rods bedded in concrete, upon which will be an inclined apron of granite blocks, everywhere dowelled together. The system resembles in the idea, that which the late Mr. Walker applied to the piers of old Westminster Bridge at some time near a quarter of a century ago; and it also resembles Mr. Page's method of foundations in the present Westminster Bridge. In the old Westminster Bridge, where the new piling was of timber, the piers failed from defects of foundation in places within the circuit of footing, as well as by the scour previously to the works of maintenance. Mr. Bazalgette's proposed arrangement is one of iron-cylinder piles, with grooves, and flanged plates sliding into them, each pile being 12 in. in internal diameter, and of 1-in. metal; but the drawings show screw-piles, which the engineer of Westminster Bridge eventually rejected, as much we believe from questions of the difficulty of driving them, as from any of economy. Mr. Bazalgette proposes to screw the piles down to a level of 32 ft. below Ordnance datum,—or 22 ft. below the bed of the river, as it appears, or 28 ft. below low-water level,—and to drive the plates down to 10 ft. below the bed. The piles generally would be 5 ft. apart, centre to centre. The top line of the piles and plates, on the river-side, seems intended to be at the level of the river-bed, 6 ft. below low-water level (or more exactly stating, ¾ in. lower than the 6 ft.): but, on the land-side, the plates and piles will be longer; since, though each will go down to the same level as on the river-side of the pier, the tops will be 5 ft. 3 in. higher. Each pile will be fitted with a cap to receive the tie-rod. There will be in all sixty of the grooved cylinder-piles in the circuit, with the flanged plates, and six more piles with plates to carry masses of rusticated masonry which are to be built in extension, up-stream and down, of the lower portion of the present piers of the bridge; and there are six different patterns of the iron caps to the piles. The grooves in the piles will be 2 in. deep, and 1½ in. wide, and of the requisite length; and the plates will be of 1 in. metal, with three ribs or flanges on the back, each 3 in. deep, and with two on the face, of 2 in. depth; and they will also be cast with a skew-back and flange at the top, to receive the granite apron. The tie-rods, each 1¼ in. in diameter, will pass through the pile and cap, and be screwed at the further extremity to the masonry of the footings of the bridge, by wrought-iron lewises, 15 in. in depth, and tightened up by a screwed nut in front of the pile-cap. The space inclosed by the "dam" of iron piles and plates, will be excavated to the level of the lowest course of footings of the bridge-pier, and to 1 ft. 9 in. below the top of the piles; and the concrete will then be filled in as the bed for the apron. A brick culvert, 6 ft. 1½ in. wide and 16 ft. high, will be constructed at the back of the bridge-pier. It will form part of the channel before referred to as provided for the flow of the tide. These important works form part of Contract No. 1, that of Mr. Furness, for which Mr. Lovick is the resident engineer.

It is not expected that the pier of the Charing Cross Bridge will require any protection, the foundations being understood to have been carried down to sufficient depth. The culvert at the back of one recess, will not be connected with the other by any culvert at the back of the bridge-pier.

The Temple Steam-boat Pier and Landing-stairs (in Contract No. 2, Mr. Ritson's, for which Mr. E. Cooper is the resident engineer), to take the place of the present Essex-street Pier, will comprise a length of 470 ft., and include a recess of 250 ft., for the "dumby" or pontoon, and an arrangement for the iron bridges, similar in plan, but different in some of the architectural details, to the arrangement of each landing-place at Charing Cross Bridge and Waterloo Bridge. The projections forming the ends of the recess, and each 28 ft. on the face, however, will be floored at the top, to form large platforms, round which the balustrades will be continued; and from each of these paved areas there will be the descent on one side, by the inclined bridge, to the pontoon, and one on the other by stairs, 17 ft. 8 in. in width, to the water. At the foot of these latter steps, there will be a gridiron formed with 3-in. elm planks, and a granite apron extending 28 ft. from the foot of the steps. These landing-stairs are, each, in two flights of steps, without turning. In the front elevation, the raking-line of the parapet appears only at the commencement of the descent, the middle landing and some of the steps being masked by a group of projections forming the base to a large pedestal. A corresponding pedestal is placed on the further side of the stairs, or on the line of the embankment-wall. The latter pedestal is flanked, like the other, but on the reverse side in the elevation, by a slight projection from the embankment-wall, 28 ft. in the face, which is crowned by balustrading, the same as that of the other projection, or large platform at the top of the steps. Mooring-rings of the lion's head pattern, and another, decorate the centre pedestals of the balustrading, and the projections of the base. As in the Charing Cross Bridge and Waterloo Bridge steam-boat piers, there is a central recess (here of 25 feet width) from the back of the main recess; and from the floor, in this smaller recess, which is part of the deck of the pontoon, the inclined iron bridges will ascend. The angles and back of this recess are terminated by pedestals, forming a group; but the back-wall is surmounted by a more prominent central feature than in the other cases. A rusticated arch, with console-head, in a structure of masonry, breaks the line of the balustrade, and carries a plinth and central pedestal for tripartite groups of sculpture.

We have heretofore ventured to say that some of the architectural features of the piers and stairs of the Thames Embankment, might be the better for revision. We have, ourselves, got almost to dread novelty, and the pseudo-novelty which is mere style; but there cannot be good art in new building, without novelty. To some extent of it, it is imperatively demanded; very little of the element is required, provided what there is else be good; and beyond the little, as every day shows, the danger of going wrong increases with the novelty, more than the ability of architects to meet the difficulty. But there is no reason why the more prominent features of the Thames Embankment should be little more than so many cubes of stone, why pedestals should never be varied by curved lines in plan and even in elevation, or why such a central feature as that which we have spoken of as belonging to the Temple Pier, should not be characterized by more of new thought. If we dispense with novelty, however, the feature referred to may be described as meritorious,—in the details.

We may mention, with a view to help to the understanding of what may be now seen in progress, that the steam-boat landing-stage and the stairs just described, will project into the river upwards of 31 ft. from the general line of the embankment. Between the screen-walls forming the back of the large recess, and the line of the embankment-wall, or in the position on plan where the inclined bridges will be, two parallel culverts of rectangular form in section, will be placed; and these will be continued each way, to open into the river at the apron which we have described as at the foot of the landing-stairs. Space under these stairs, and under the platform or top landing, will be apportioned to a reservoir for storing water for flushing. Under each of the two reservoirs there will be three other culverts, of rectangular section, two being 4 ft., and one 4 ft. by 3 ft. wide. The smaller one will be carried in a straight line from the end of the landing-stairs to the recess for the pontoon. From the two culverts, at the base of the wall forming the back of the large recess, there will be openings 3 ft. by 3 ft., for flushing the space of the recess. Also for the same object there will be, at the bottom of each of the reservoirs, cesspits with outlets into the pontoon-recess, the outlets being fitted with sluice-valves. In some parts of the substructure, a section shows the five culverts side by side, occupying a total breadth of 27 ft. or 28 ft., the divisions being 2 ft. or less. Considering the scour, is this construction quite sufficient? It will be recollected that the storm-water outfall from the Essex-street sewer, the arrangement of which was spoken of in a former article, is connected with the substructure of this steamboat-pier: the outlet is placed in the middle of the length, or in the recess; and ample provision for flushing has been rightly considered to be required.

We have thus described the provision made, in the two contracts, for the steam-boat traffic. There are two places at which there are to be landing-stairs which we have not described. For the "York Stairs Landing," it is intended to remove York Gate, at present at the end of Buckingham-street, and to place it opposite to the houses of Whitehall Gardens, projecting from the face of the embankment. Mr. Bazalgette deserves praise for his intention to preserve what he can, of a work which is regarded with so much interest by architects. We are frequently suggesting that, when good work exists, but has to be removed, the work might be set up somewhere, as in one of the parks, with more advantage decoratively than is derived from the consignment of the fragments to the

* See p. 786, *ante*.

yard of the dealer in old materials, and with some retention of the interest which the work may be supposed to afford as a link of the chain of art-history; and we do not cease to regret some precious fragments and some opportunities that have been lost. But when the object is to preserve, as little alteration as possible should be made. A considerable alteration will be made in York Gate, as well by omission of something, as by addition. We regret especially, that the original arrangement of the steps, base, and foreground of the work, which may be yet identified in every detail, or with the help of published drawings, should be departed from,—deeming the breadth of landing, and steps in front, of much value. We dwell upon the matter, because it is much the fashion to omit or modify features which were of the entirety of a design, and yet to expect a result the same as without the alteration. It must be admitted, however, that Mr. Bazalgette's task was a difficult one without encroaching upon the footway of the embankment, or projecting farther into the stream. The old site was always about the same level above the water or foreshore,—albeit the latter foreground has of late been one of disgusting mud: at the new site, two separate designs, as it were, have to be considered, one for the state of high-water, and the other for that of low-tide when a substructure of the work must appear. We would rather have had the gate what it is, or was, found a place for it on the land-side of the embankment-road, as the entrance to any gardens that may be proposed, and designed new landing-stairs for the situation between Westminster and Charing Cross Bridges. The works now contemplated, comprise a space in the length of the embankment, of 108 ft., whereof the old work of the gate stands for 28 ft., not including the three-quarter columns at its ends. The 108 ft. space is the length of a projection from the general line of the embankment-wall, of which the two lengths of 40 ft. each, at the ends, are to be balustraded, two end-pedestals carrying lions *couchant*. The projection affords a recess from the footway, of 5 ft. 6 in., which will be furnished with stone seats. Recesses similarly furnished might have been provided elsewhere in the line of embankment, with advantage. Rests for goods, should not be forgotten now, and should be made not unsightly. The basement of the projection mentioned, which will be all concealed at time of high-water, is designed in the manner of "vermiculated" rusticated work. The gate projects 15 ft. 6 in. further; and the landing and its substructure other 10 ft. From this landing, stairs, 10 ft. in width, will descend right and left in three flights, without balustrades. The face of the substructure of the landing and steps, looking from the river, will have the same character of rusticated masonry as the projection already described; but carrying the landing, there will be a bold arch, with carved console, forming a recess beneath. The steps, in the side flights, will be major and filling-in steps, an arrangement conducive to effect rather than to safety in descending. The two spaces, on plan, left between the steps and the projection from the embankment-wall, will be each paved, on concrete, with granite,—laid to an incline; and there will be four culverts, 12 in. in height, for the passage of the tidal-waters from one recess to the other through the base of the structure, and to each recess, three smaller and more flattened openings, which will be connected with a reservoir of six compartments, to be stored with water for flushing, and also connected with the requisite sluices and gearing. The material of the substructure, and steps, generally, is to be granite; and the steps will be dowelled together with slate-dowels. The balustrade is to be of the same material; and a shell will be carved on the dado of each of the lamp-pedestals, in lieu of the lion's head generally used in the embankment.

The landing-stairs between Charing Cross and Waterloo Bridges, will be placed about opposite the Fox under the Hill, or Salisbury-street. The work will comprise a length of "special construction," of 190 ft., and will include a flight of six steps, 50 ft. in width, leading down at right angles from the line of the embankment, to a landing of 50 ft. by 18 ft. 9 in., whence there will be two return flights, or parallel with the embankment, each occupying 40 ft., down to the water. The remaining 60 ft. of the length of special construction, will be made up by the ends of a slight projection from the embankment. As in most of the works described above, the excavation for concrete is to be carried down to 20 ft. below the Ordnance Datum,—that is, it may be, 8 ft. to 12 ft. below the bed of the river. The concrete in the work we are now describing, is specified to be 8 ft. 4½ in. in depth. The steps do not appear in the front elevation: there is a parapet-facing of masonry next the river, which is finished by three pedestals for lamps. Other pedestals on the embankment-wall, in the drawing are shown bearing lamps. The mermaid forms in these last should be exchanged for forms more architectonic, and wherein figure-sculpture, if used, should be *applique*, not substituted for the structural. Large block-pedestals are also shown, flanking the central stairs and bearing colossal sedent figures. Each of the lower flights of steps is flanked by two lions couchant. The substructure of the steps and landing, including cross-walls and arching, is designed with culverts, storage-space, and sluices, to serve flushing purposes, as before described. There will be three spreading outlets, at the foot of each of the lower flights, in the riser of the bottom step, and each 3 ft. in width by 9 in. in height. In connexion with these, the opening of an end-compartment of the reservoir-space under the steps, will be fitted with a sluice-valve. Further, there will be a culvert from end to end, next to the embankment-wall, into which access will be provided from the several chambers of the reservoir, by openings; and this culvert also will be fitted with sluice-valves, one at each end. The area around this landing-place, in the river, for 12 ft. from each end of the stairs, and 6 ft. in front of the embankment-wall, is to be paved with granite.

We have now completed our particulars of the whole work as designed, of the two contracts for the Thames Embankment, which are in hand, and extend from Westminster Bridge to Whitefriars; and we have given, in our first articles, some account of the gestation of the work generally. We stop short, having not described what is proposed for the connexion between the present limit of the work, east, and Blackfriars Bridge, and what is in process of design for the Surrey side of the river. The drawings for these portions of the great work of embanking both sides of the Thames, are yet incomplete. We have, however, given particulars that will enable many of our readers to understand the works in progress, in which they cannot but take much interest,—works that without some preliminary information would be likely to seem hopelessly complicated, as they are certainly characterized by extraordinary elaboration in the details.

THE LATE MR. C. H. SMITH, ARCHITECTURAL SCULPTOR.

Few members of the Institute of Architects, the Society of Arts, and other cognate associations in London, will hear without regret of the death of Mr. Charles Harriott Smith, who was always ready to say something on the subject under discussion; and, moreover, always had something to say that might be usefully listened to.

Mr. Smith was born on the 1st of February, 1792, and died October 27th, 1864, of cerebral irritation, of long standing and terminating in paralysis. His scholastic education was very limited, for he left a very common school at twelve years of age, to go to work. He occasionally spoke, in after-life, of being indebted to Mr. Bonomi (father of the present curator of the Soane Museum) for drawing his attention to higher branches of art than those he was pursuing at home with his father as stone-mason. Valuable is a word in season. When he entered the Royal Academy, in 1814, he became acquainted with many students who afterwards proved warm and useful friends; one in particular, Professor Donaldson, who will perhaps recollect what he did for him in furthering his education about that time. If the good-hearted Professor should forget, he may be assured that the subject of our notice never did.

Mr. Smith passed through all the schools at the Royal Academy (we do not know of any other student who ever did so) by drawings of the human figure. In 1817 he obtained their highest rewards for architecture, and consequently enjoyed the privilege of free admission as a student at all times during his life. Starting thus, he might have aspired to practise one of the highest branches of art. Circumstances, however, led him to producing rather than creating. He executed the Corinthian capitals and other architectural adornments at University College, the National Gallery, the Royal Exchange, and elsewhere, and was appointed, without application, one of the four commissioners to travel through England and Scotland in search of a fit and proper stone for the New Houses of Parliament. With the conductor of this journal, he afterwards visited the stone quarries of Caen. If the advice that was then jointly given to the quarry-owners had been followed, their stone would have been held in better repute in England than it now is for external work. Later, he was a member of the Government Committee appointed to inquire and report as to the condition of the stone of the Houses of Parliament.

Mr. Smith became a life member of the Society of Arts in 1813, and for many years took a lively interest in its proceedings. This was the only society to which he ever subscribed, feeling justly proud that to all other institutions he was admitted by invitation. His writings and lectures were numerous and varied in subject. Many papers with his name to them will be found in our own pages. In his latter days he called himself a "strange mongrel of art, science, literature, and business." He was an occasional competitor for architectural works. For the Nelson column at Charing-cross he made a large model of his design. The last design he submitted was for the proposed museum in Kensington, of which some notice was given by us at the time. Looking through the old catalogues of the Academy we find he exhibited in 1809 a design for a villa; in 1810, a view of Chelsea Hospital, from actual measurement; 1813, a design for a church; 1815, a design for an edifice to commemorate the victories of Wellington in the Peninsula; 1817, a design for Pantheon of the Heathen Deities; 1818, a bust of his father (in wax); 1821, a design for the interior of a Pagan temple; 1822, a bust of a lady; and in 1824, a bust of the Hon. and Rev. E. J. Turnour.

In 1855 he was elected honorary member of the Institute of Architects,—a distinction of which he was very proud. Mr. Smith had made himself, as many will remember, a thorough master of perspective, and his knowledge of lithology is well known. As we have already said, he possessed great general information, and was always ready to impart it to others who sought it. As one of his old workmen said recently,—"He never grasped for money, but he did for knowledge, which he held fast, but nevertheless gave it away abundantly."

We record his death with regret, and hold his memory in esteem.

THE LATE MR. ALFRED TAYLOR, C.E.

We regret to have to record the death, from diphtheria, on the 23rd ult., of Mr. Alfred Taylor, C.E., of Crosby, near Liverpool. Mr. Taylor, though but in his thirty-first year, was getting well known as a sanitary engineer. Commencing as a pupil with Mr. Hibbert, C.E., and afterwards with Mr. Henry, when engaged on the Wolverhampton water supply and drainage works, after executing several large surveys, he was engaged by the borough engineer of Liverpool, Mr. Newlands, at whose office and works he was not slow to avail himself of the first-rate opportunities which presented themselves for improving his practical knowledge. Thence he became the engineer of Merthyr Tydfil, where he carried out a good deal of drainage and other work, and removing to Waterloo, near Liverpool, completed the system of sewerage there which is now in operation. A few years ago Mr. Taylor commenced private practice, and carried out some difficult and successful land drainage works for Mr. Weld Blundell, at Birkdale, near Southport. He also made surveys of both Birkdale and Crosby, for their respective local boards, and laid out a system of inland drainage and deodorising tanks for the latter, which met the approval and warm support of the Government inspector, Mr. Rawlinson. In addition to these, he executed many private sanitary works, and as architect produced some meritorious buildings. Mr. Taylor's character was distinguished by energy and thoroughness, sparing no pains, when about to undertake any new work, to inform himself of the details of the most successful works of the kind that had up to that time been carried out. In him we have lost a promising engineer, who, doubtless, by his practical talents and excellent judgment, would, had he lived, have raised himself to a foremost place in the profession.

JOHN LEECH.

On Saturday last died—not unexpectedly by those who had the honour and pleasure of his acquaintance—John Leech, the "back-bone" for many years of *Punch* "proper,"—the mainstay of "Punch's Almanac,"—and the clever artist of many a clever coloured frontispiece to "Mr. Punch's Pocket Book."

Mr. Leech was born in London, in the year 1817, and educated at the Charter-house. The house in which he was born should bear an inscription. He carried, he was wont to say, few scholastic acquirements from Sutton's foundation. He was born to read men, not books; and destined to find in London society, high and low, in London drawing-rooms and in London streets, inexhaustible materials for his ever-ready and, in its way, inimitable pencil.

The name of a friend, and that friend a man of genius (for such was Mr. Leech) is the cause of recalling many little reminiscences, at all times pleasant; but when Death has closed the all-observant eyes of that friend,—when we must say,—

> "The hand of him here torpid lies
> That drew the essential forms of grace;
> Here closed in death the attentive eyes
> That saw the manners in the face;"

they return with additional associations of sadness and delight. Such mingled feelings are the writer's at this moment. We (who have flourished from 1834 to 1864) shall not have the good fortune to see another John Leech.

> "A king's or poet's birth doth ask an age."

The residences of men who will be remembered hereafter deserve to be pointed out, and, if possible, preserved. When Mr. Leech first made himself a household picture in ten thousand families, ten thousand taverns, ten thousand coffee-houses, and a long "*et cetera*" of places, he was living at No. 9, Powis-place, Great Ormond-street, London. His farewell to Powis-place, and removal to Brook-green, where he first made immortal "The Brook Green Volunteer," was commemorated by a "dance" in his then empty house in Powis-place, and a supper, *à la* Gunter, which carried mirth and light heels into milk-boy hour next morning.

From once aristocratic Powis-place, as we have said, he removed to Brook-green, where he had his ever faithful and cheerful friend and editor, Mr. Mark Lemon, for his near neighbour. A bow-shot off he found Comic Blackstone A'Beckett, of *Punch*, living near Punch's Railway (of whom many pleasant reminiscences might be told), and Mr. Perceval Pips Leigh, whose Diary in the manner of Mr. Pepys conveyed with marvellous truth and quaintness the follies and fashions of London as it *was*. Here he saw the Brook Green Volunteers (Wilkie was to have painted a Brook Green Fair,—a fair in earnest,—which the writer of this column "In memoriam" remembers to have seen, with all its innocent pleasantries,—more like Bury Fair in Shadwell's amusing comedy than Bartholomew Fair in Ben Jonson's still more amusing comedy of that name); and Brook Green will be remembered hereafter for the artistic talent which its turf gave rise to.

This inimitable artist is said to have been sent to a too early grave by the continual boredom of Italian organ-grinders. One of his "Punch" *punch-on-the-heads* of these perambulating nuisances, who can readily forget? The cut is slight,—the work, perhaps, of half an hour, done while dressing for dinner, or a late meet with the hounds with his friend Mr. Mowbray Morris at Melton Mowbray. The "wording" beneath the cut is as follows:—"One good Turn deserves Another. The lazy Organ-grinders have had it all their own Way with the Monkeys. Now, then,—Change about!" The gorilla, wild with delight, is pulling the chained Italian grinder to the top of his monkey-board. The grinder himself is equal in *effect* to the grinder in Wilkie's inimitable "Parish Beadle."

Let us here recall to remembrance another all-perfect-in-its-way "cut" of our deceased friend. The literature of the illustration is as follows:—

"CANINE.

Patron.—'Well, but you don't mean to say that such a dawg as that could *draw* a badger?'

Fancier.—'Not *draw* a badger! Why, bless yer 'Art, it would be a little 'Oliday to him!'"

The listless doubt on the swell patron's mind, and the cheeky assertion on the fancier's, are alike perfect from top to toe; while the representation of "the dawg," to use a slang and common expression, "beggars description."

It is well known beyond the walls of the Royal Academy of Arts, the dear little Garrick Club, and the solemnities of the Athenæum Club, that Mr. Leech was desirous of becoming a painter—a painter in oils. We have no wish to reveal the handsome sums which inimitable Mr. Leech received from the ready-handed and high-minded proprietors of *Punch*; but it should not be concealed that Mr. Leech was naturally desirous of perpetuating on panel or canvas—or both—some of the thousand scenes he has drawn on wood,—here with a touch of Hogarth; there with a touch of Wilkie; and here again with a touch of Frith. He wanted a true eye for colour: his fancy worked faster than his hand: he tried in a small way and did not succeed. Nor are we altogether sorry: the time spent in *perhaps* perpetuating *one* perfect work would have undoubtedly robbed us of *many* all-perfect sketches. This *all-observant* artist acted, as an amateur, in *three* plays,—in Shakspeare's "Merry Wives of Windsor," as *Slender*; in Ben Jonson's "Every Man in his Humour;" and in Beaumont and Fletcher's "Elder Brother;" and yet, strange to say, he had no one quality to commend him as an actor, except his "figure," which was handsome, and his "get up," which was perfect. He was great on "wood," but not on "the boards."

England has lost a valued friend.

OPENING CONVERSAZIONE OF THE ARCHITECTURAL ASSOCIATION.

The usual *conversazione*, by which the sessions of this Association are opened, was held on Friday evening, the 28th ult. A variety of architectural drawings and works of art were scattered through the rooms, and the band of the 1st Middlesex Volunteers attended to enliven the proceedings. The attendance of members and their friends was numerous.

The chair having been taken by the president, Mr. J. H. Christian, some formal business was transacted, after which

Mr. E. G. Tarver, president of the class of design, read the following report on the drawings submitted for the prize given by Mr. Tite, M.P.:—

"The judges having carefully considered the different designs submitted in competition for the prize given by Mr. Tite, are of opinion that that submitted by 'Cinque-Cento' is, as far as the general character of a design for a police court (in accordance with the instructions issued) is concerned, deserving of the prize. In coming to this decision the judges cannot refrain from noticing the design of 'Justitia' as being well worthy of commendation; as are also the carefully-worked out details and arrangements of 'Utilitas.'"

The President then called upon Mr. J. Johnson, the successful competitor; and, having addressed a few words of congratulation to him, handed him the prize. He also announced that Mr. F. B. Brooks was the author of the design signed "Justitia," and Mr. H. A. Reeves of that signed "Utilitas."

Mr. T. R. Smith brought up the report on the best essay on iron as applicable to architecture. It was as follows:—

"The judges appointed to adjudicate the prize for the essay on iron beg to report that only one was submitted. They are, however, of opinion that it fully merits that the prize should be awarded to it; showing, as it does, a good acquaintance with the subject generally, and considerable familiarity with some of its details. At the same time they cannot but express their regret that a larger number of competitors did not come forward, and their conviction that the subject of the iron prize, and the best method of inducing members to compete for it, deserves to receive the serious consideration of the committee."

It was stated that the writer of the essay was Mr. R. R. Bayne, who is at present absent from England on professional business.

Mr. R. W. Edis brought up a report from the judges of the class of design, stating that, having examined the sketches sent in during the last session, they had "unanimously awarded the first prize to Mr. G. H. Birch, for a series of clever and carefully-drawn sketches; and the second to Mr. R. R. Bayne."

The President then read his address, of which we give some passages. After briefly alluding to the progress and position of the Association, the reader said,

"The most remarkable additions to our street architecture that have risen of late, are the great hotels. They have the merit of being fine lofty buildings, grand in mass, and of good sky line, having perfection of arrangement and accommodation, and every possible luxury that a vast outlay of money can insure. But, considering that they are built on practically interminable leases, little of this money has been expended on art, and none on figure sculpture, for which no better opportunity is likely to arise. I had rather the money spent on the cross at the Charing-cross terminus had been so applied in or on the hotel; for I think the two (the hotel and the cross) incongruous, and that the latter may possibly be found in the way. Nevertheless, the Charing Cross Hotel is one of the best, and the station behind it very fine, from its size, simplicity, and grand proportions. I fear we must wait some time before our Domestic Gothic is sufficiently developed to present us with a really fine hotel designed on true Mediæval principles. Any one who has looked at London from a distance will admit that these hotels are giving great variety to the very dull general level of house-tops, and, in addition to our towers and spires, add much to its picturesqueness.

Another class of buildings that have been largely added to of late is the music hall. Owing, I fear, to the sins of omission and commission on the part of the lessees of our theatres, hot houses and long and late hours undermine the constitutions: as the so-called adaptations from the French enervate the minds and imaginations of their audiences, these finally succumb to bad costume and sensation scenery of the most reprehensible character. Some of the music halls seem to have embodied in their architecture all the faults that the theatres show in connexion with their managements; and I venture to hope that their number will not be just yet increased.

I have only time to advert to one amongst the numerous works both of architecture and building now in progress in the City, viz., the restoration of Guildhall. We shall shortly, I hope, see that noble building completed with its open timber roof somewhat after the fashion of its sister of Westminster. It was originally covered, I believe, by a roof supported on stone arches thrown across at intervals; but this was ascertained too late for its restoration in that form.

The churches built of late in the metropolis are too numerous to admit of mention here. Many of them show a near approach to perfection in ecclesiastical architecture.

Engineering works ought not to be overlooked. In addition to the station at Charing Cross before mentioned, the works in connexion with the railway at Blackfriars, and many of the new suburban stations, show great signs of improvement, but still leave ample room for further advance. The Association has an opportunity of helping this advance, as one of the prizes next year is for designs in connexion with this latter subject.

Engineers have at last come to the conclusion that their work, to be good, need not be ugly. Charing Cross Bridge is redeemed by gilding and colour. All the small mechanical works of the Middle Ages were seemly if not artistic; why then should we so long have spoiled our greater and grander work for want of a little art and from a love of dirty, black, or dull colour?

I hope the viaduct across Ludgate-hill will agreeably surprise us in this respect.

The Thames Embankment offers unusually fine opportunities for grand works on its quays; which may be great national monuments or night-mares.

As some amongst the many fine works in the country I would instance the splendid chapel of St. John's at Cambridge, to which, I believe, a lofty tower is to be added by the munificence of a private individual, and the new buildings at Christchurch and Merton, at Oxford, as examples of good work; though I question the wisdom of using the Venetian Gothic in the midst of so much that is English.' * * * *

"My own opinion is, that however clever we are in the manufacture of glass, we have not yet arrived at the power of designing it, and that until this is the case, the less we execute the better. What is to become of all the bad glass that has been inserted in our churches and cathedrals? Unless another race of Iconoclasts arise, I fear we shall have no room left by the time we have arrived at proper ideas on that subject.

The committee for filling the windows of Glasgow Cathedral evidently think with me, up to a certain point, as they have passed by all manufacturers in this country and imported their glass at a vast expense from abroad. Whether they have fallen from the frying-pan into the fire, I leave to be determined by those who have seen the results.

In the beginning of March Mr. Scott read a valuable paper to the Association, and gave his

thoughts and suggestions on the education of architects; at the same time proposing a scheme for united action with the Institute, which scheme has since been considerably matured, and I hope there is every prospect of it being ultimately carried out. I beg to remind you that you have pledged yourself to the support of this scheme, and I hope you will give your individual and collective assistance to its furtherance.

Many of our members, with whom I most cordially join, think that in the meantime we should get up a class for the study of the drawing of the human figure, so as to be ready to join the larger scheme of the Institute when matured. We have made inquiries as to cost of rooms, models, &c., and a thoroughly efficient artist has offered his services for instruction once a week. Detailed information will be given to members by the secretary of the sub-committee appointed to make these inquiries, and I do not doubt that we shall have many students, both in and out of our Association, anxious to avail themselves of the great advantages that this class will offer.

I think it would be unwise and selfish in the extreme to confine it to the members of the Association only, when there are many students in branches of art connected with architecture very anxious to join us.

I am no way surprised at the anxiety of some of our members to lose no time in entering on the study of figure-drawing, as that study is the basis of all good art.

If we wish to aid in the development of a natural style of architecture, we *must* lose no time; for this great and important study has been hitherto almost entirely neglected by the majority of architectural students, many of whom have been led away by a weak admiration of so-called originality. And here let me remind you of what Mr. Scott told you in his lecture:—'Let an architect be as original and as inventive as he pleases, but let his originality and invention be founded on a basis of knowledge, and not, as much so-called originality most obviously is, on a foundation of ignorance.' I hope that this advice will be taken to heart by all students of architecture, and then we shall see less and less of designs where every true principle of architecture is ignored, and unmeaning details elaborated to a degree that fatigues the eye and distracts the brain.

Vast advance has been made in the execution of good ecclesiastical work, and we should now turn our serious attention to civil and domestic architecture. To do this we must put ourselves on a par with the most successful of builders of ancient times, by a more artistic education, and by the study of the figure; for you will acknowledge that in almost every period good architecture and knowledge of figure-drawing were co-existent.

Our more extended knowledge of all styles of architecture ought surely to give us some advantage over the old men; but I fear our knowledge is only superficial, and must, before any good is realised, go deeper into the fundamental principles by which they were governed."

Mr. Burges, having been invited by the chairman to make a few observations, said he thought it unnecessary that he should do so. He might, however, be allowed to say, that he was glad to find that the Association contemplated a class for figure-drawing, which he regarded as a most essential element in the education of an architect; as, if the profession were to study the human figure more, and notches and chamfers less, the result would be most satisfactory. With regard to many modern Gothic buildings, he felt bound to say that, as a follower of the Gothic school, he repudiated them altogether.

Mr. Hayward announced, on behalf of the Royal Institute of British Architects, that that body had under consideration the suggestion of Mr. Gilbert Scott, with respect to a school for the education of architects; and that a report on the subject would shortly be submitted.

This terminated the formal business of the meeting. The ordinary meetings will commence on the 11th inst., when a paper will be read on "Tone in Architectural Work."

The sketches of the Class of Design will comprise drawings for a large church adapted to the modern ritual.

Decay of Wood Carvings.—We have before us the report of the commission appointed to inquire into this subject, but must postpone notice of it.

WINTER EXHIBITION OF CABINET PICTURES, PALL-MALL.

The twelfth annual collection of pictures offered for exhibition during the darker and more dreary months will be as acceptable as any of its immediate precursors, although much of the distinctiveness that belonged to the "Winter Exhibition" in its earliest successes has dwindled to nought, and the roomful—as far as hanging space may interpret such a meaning—of pleasing and clever works may almost be regarded as supernumerary to the more important and past exhibitions of the earlier season, if the generally even merit of the contributions did not suggest a difference, and a welcome one, in an unusually strict system of selection. Thus of the whole number of its items some 200—it may justly be said that, with about 10 per cent. for exception, all will be found to repay examination, many to leave an agreeable impression, and a few to evoke genuine admiration and secure a long recollection.

In this last division, Mr. E. M. Ward, R.A., holds a prominent position. He has painted with all his customary vigour and aptitude for expressing character a very touching little incident from French history, titled "The Dauphiness, Daughter of Louis XVI., and Robespierre in the Prison of the Temple" (36), described by the Princess in the Memoirs written by herself.

"I swept the room every day. . . . . One day there came a man whom I believe to have been Robespierre; the municipal guards paid him great respect; his visit was a secret to the people of the tower, who knew nothing about it. He looked at me insolently, cast his eyes on the books, and after having recalled the municipals, he retired."

The impersonation of the patient princess, as well as that of the audacious intruder, whose attitude and air of assumption are in strong contrast to hers, of meek submission to circumstances, is so strikingly lifelike, and all the accessories have so much reality imparted to them, that this may rank with Mr. Ward's best illustrations of his favourite epoch.

(65) "Near a Brook, through the Forest of Bohemia," if it do not thoroughly well represent Mr. W. C. T. Dobson, R.A., is yet a very attractive and refined specimen, though like (83), "Hide and Seek," by Mr. H. Le Jeune, A.R.A., somewhat too cold and classic.

Mr. W. G. Orchardson shows that he need not confine himself to portraiture to earn reputation; his skilful method of execution tells to extraordinary advantage in a very spirited representation of probable occurrence, (190) "The Challenge—A Puritan's Struggle between Honour and Conscience." There is admirable dash in the action of the cavalier as he is ceremoniously presenting the missive on the point of his long rapier, to the heavily built but by no means unimpressionable Roundhead, whose inclination to receive it is sufficiently apparent, in spite of the religious objections urged on him by his pastor, and evidently his master, who clings to him in nervous dread of his advice being disregarded. This excellent combination of manipulative dexterity and terse conveyance of a story, will cause Mr. Orchardson's name to be looked for in time to come.

(33) "The Flower and the Leaf," by Mr. G. D. Leslie, is poetically conceived, and, like a chapter from a well-written romance, awakens sympathy for very everyday emotional occurrences, which, though appropriated to a fifteenth century experience of them, are felt and understood as if no period could change the susceptibility of their effects. A pretty lady is gazing with pity at a nun, once as fair and favoured as herself, and while she plucks the bright-hued flowers at her will, appears to wonder why only the leaves should fall to the share of others, and why her life's walk should be through a delightful garden, and that of others through a cemetery.

Mr. W. Maw Egley's ambitious and clever historical picture of "Francis I., sick and a prisoner, visited by his sister Marguerite d'Angoulême and the Emperor Charles V." (9), would have been immensely improved if he had judiciously restrained his love for strong colour and lost some of the hard outlines that cut it in pieces; but it has been carefully studied, and would be conspicuous anywhere. Mr. F. B. Barwell sends (46) "The Reconciliation," a smaller edition of his well-known large work.

(57) "Olivia,—Twelfth Night,"—by Mr. T. F. Dicksee; (58) "The Milk Boy," by Mr. Joseph Clarke; (75) "Juanita," by Mr. J. B. Burgess; (76) "Barbelie at Breakfast," a charming little study by Miss E. Osborne; (95) "The Song of the Nubian Slave," by Mr. F. Goodall, R.A. (a repetition of his diploma picture); (101) "Italian Peasant Girl" (not Italian at all, Mr. J. Hayllar, but very good); (110) "While he drinks thy wine, believe not all he says," Mr. J. B. Burgess again; (123) "The Water Nymphs," by Mr. E. C. Barnes; (178) "Raising a Churchrate," by Mr. J. Morgan (a large, well-painted, but rather uninteresting realization of commonplace fact); and Mr. G. E. Hick's agreeable ideals, who draw the long-bow in 191, and two or three other instances, are all to be admired and noted.

There are numerous equally good landscapes, and from among the artists where name alone is guarantee of a certain excellence, Messrs. Linnell, Creswick, R.A., Hulme, Vicat Cole, A. Gilbert, Percy Williams, Syer, Leader, Boddington, Peel, Hargitt, Dawson, and Bright may be given. Mr. E. W. Cooke, R.A., has (42) "A Sunset, near Venice;" and M. H. Koekoek some clever seascapes.

Nor is cattle painting unrepresented, thanks to Mr. T. S. Cooper's "Sheep" (183) and Mr. Davis's ditto in "Warm Weather, Artois" (86) very like truth, and admirably composed. Moreover, there are several very noticeable foreign pictures that assist considerably to uphold the value of the gathering, and these have all their leaven of interest, culminated in a charming example of M. Edouard Frere, entitled "The Writing Lesson" (3), one of those little gems that defy imitation, and are provokingly isolated by the indescribable quality of this superiority. It is difficult to account for the exquisite pleasure derived from watching so homely-looking a child scrawling, in a very immatured style, at a very matter-of-fact writing-desk; and for such a satisfying result with so little effort to secure it,—a peculiarity, though diffused in a lesser degree throughout the emanations of others who belong to the same school, by which the works of this incomparable artist are at once identified. Had nothing of his been present to question it, M. Duverger's "Granny's Helper" (62), a mite of a maiden threading an old dame's needle for her, and other similar productions, would claim for their authors a larger share of naturalness and grace than they really possess in common with M. Frere.

ARCHITECTURAL REVERIES.

THE WINDOW.

Many unexpected questions are continually presenting themselves for solution to the student of architecture, in its beginnings, its developments, and its artistic principles; and associations seemingly more akin to the course of history, the domain of poetry, or the philosophy of the sentiments are constantly arising. Every architectural façade consists of certain distinct features, each with its special function to perform; and each being capable of almost as great a variety of expression as the features of the human face itself. Architecture has also a language: not a spoken language, still less a written language; yet one producing an infinite number of impressions, of the most diverse character, upon those to whom it is addressed. To the worshippers beneath the lofty vaults of the cathedral it gives forth, as the outbreathings of its stately forms, soundless, yet solemn and beautiful words, full of majesty and dignity; while to those passing within the massive walls of its prison-houses, and entering their frowning doors, clothed with huge fastenings of bar and bolt and chain, words seem to be muttered of terror and disconragement such as might have suggested the line of Dante,—

"Voi che entrate, lasciate ogni speranza."

On the other hand, to the dwellers in "summer palaces," the dreamers in the shades of garden pavilions, or the loungers in sparkling theatres, architecture addresses itself in light and playful phrases, bright with the graces of fanciful ornament and the symbols of quaint and elegant device. Architecture has also its literature: not one of mere letters, yet one engraven like the chronicles of Assyrian kings, upon the walls of its own monuments. And it is a literature, not of art alone, but of poetry and history. Yet it is a literature, whose pages are only intelligible to the true devotee. To those only who are endowed either by nature or study with that refinement of artistic sentiment which we call taste, will those pages reveal their fullest meaning. And these are comparatively few; for true taste is a faculty that emanates from the highest

regions of the intellect. "*Il faut avoir de l'âme pour avoir du goût*," has been truly and poetically said by a French author, and the aphorism is as true as it is poetical. It is, in fact, by "taste,"—that delicate feeling which seeks order, proportion, and fitness in things,—that man is distinguished from every other living creature; and a great authority, Cicero, has expressed this idea with his usual neatness and accuracy. When speaking of man's instinctive search for a law of order and measure for his words and actions, he describes the quality of the thing sought as "quid sit quod deceat," *that which is fitting*, an axiom which applies equally to works of art as to moral actions; and where the power to test the presence or absence of this abstract "fitness" is not possessed, the absence of "taste" may be inferred as a natural and, in fact, inevitable consequence.

In speaking of architectural features, and their expression, the windows of a building may aptly be called the eyes; for although a humorist might urge that, at all events, they are but glass eyes, the thrust need not disturb an analogy which it is not sought to make a very close one, as many other and more cogent objections might be made to the accuracy of the analogy: for instance, the number of this architectural feature, ever varying according to the necessities of the building, might at once appear an all-sufficient objection. And yet it is not altogether fatal; for the single eye of the Cyclops might find its architectural analogy in the solitary window in the vaulted dome of the Pantheon, destined to light the entire building; and the hundred eyes of Argus might find their parallel in as many different palaces. And then, it is not absolutely necessary to call in fable to our aid, for among the lower orders of animals the number of eyes is exceedingly various, according to the nature of their organization and its requirements. The larvæ of the *telephoroides*, a genus of beetles, are only furnished with a single eye; while those of the genus *cassida* have three; and those of *staphilides* four. The larvæ of *lepidoptera* (the butterfly class of insects) have almost invariably six; while in other types of lower animal life the eyes are often exceedingly numerous. And so the creator of architectural eyes may make their number ever varying, according to the exigences of the work he is constructing, without utterly destroying the analogy which it has been sought to establish.

Let us, therefore, call the windows of a building its eyes; for those features certainly seem to look forth upon us, like living eyes, with more or less of welcome or repulsion, according to their expression, the result of their design, position, and proportion. The gracefully-designed window, with its superincumbent lines of architrave or pediment, serving as the architectural eye-brow, beams upon us with a bright and pleasing glance; while the ill-formed opening, without a single line of moulding, like an eye without lids, glares towards us with a broad uncomfortable stare. In still ruder forms of structure the offensive expression is still more marked. And when accidental defects are superadded,—in the shape, for instance, of broken panes patched with rag or paper,—the effect of a human eye damaged by vulgar conflict or loathsome disease, and wearing its squalid bandage, seems so graphically reproduced that we gladly turn away. And thus, both in beauty, and at the other extreme of the scale of art, the analogies between the architectural eye and the human eye seem to persist in asserting themselves. Such are a few of the considerations which seem to invite us to look upon the windows of a building as its eyes so long as we regard its exterior; and when once inside the structure the windows actually become our own secondary eyes, through the medium of which we are alone able to distinguish external objects. This architectural feature appears, then, to be a most important one, and it may be well to devote a few lines to the consideration of its artistic treatment with reference to the functions which it has to perform and the expression it ought to wear. To a certain extent, indeed, this effect has ever been produced, almost unconsciously, by the architect, forced by the necessities and general character of the work in hand to the acceptance of certain unescapable conditions; but this is not sufficient,—an architectural feature should be something more than a tolerable and unavoidable accordance with the purpose of the building of which it forms a part. The effect of the most perfect possible accordance should be achieved, especially in a window, by the most careful and even caressing treatment; which ought to result in imparting to the feature a character so unmistakeably appropriate, and so felicitously expressive as to invite, or rather command, immediate remark and approbation on that especial account. To produce this effect there is no occasion to resort to exaggeration, nor to become in any way over-emphatic: it is only required that the emphasis, strong or slight, should be in the right place. In seeking for this expression, this emphasis, the student should above all things take care not to be led away by the fascinations of any well-marked style belonging to a former epoch; for in this way he may be led to impart to his design a form and character which, however beautiful in themselves, and from a certain point of view, will yet be inconsistent with the manners and the spirit of the period in which he lives. This is an aberration towards which there are strong temptations, as so many are to be found among the public who honestly admire modern Gothic buildings without having advanced so far in the culture of their taste as to ask themselves whether it is right to admire a slavish readaptation of the styles of the past to the works of the present. Let the architect beware of servile reproductions: an "architectural eye" of one period may have been very beautiful in its own age, when instinct with the artistic life of its epoch; but galvanized into an unnatural existence in the present day, it cannot legitimately possess the same charm. It is as the bird of beautiful plumage when stuffed by the naturalist and placed in a glass case, compared with the same creature full of life and motion, gorgeous colours glistening with the chequerings of alternate shade and sunlight in its native forest.

At all events, it may be safely stated, that the forced introduction of an obsolete style is sure to carry with it more or less of inconsistency. For instance, at the period when the finest of the Italian palaces of Florence and Rome were erected, it was a necessary condition in the residences of a turbulent and almost lawless race of feudal nobles, in an almost constant state of petty warfare with each other, that they should be at once both house and fortress. The windows were the features most especially influenced in their treatment by this necessity. The walls being built of far greater thickness than was necessary for mere architectural solidity, the openings for light had to be pierced through this massive defence, giving to these "architectural eyes" a deep-set character and forbidding expression which was increased by the necessity of making them as small as possible, consistent with the admission of a tolerable supply of light; and they were as few and far between as could be devised consistently with imperative requirements. The style of these buildings, designed by a truly artistic race of Mediæval architects, is almost invariably striking, and often beautiful,—qualities which have tempted modern architects to resort to absolute imitations of their forms; and in adapting them to modern residences, even the small size and small number of windows have been observed with scrupulous accuracy. This observance has certainly had the effect of reproducing the true Mediæval character of those buildings, but at the vast cost of appropriateness, and, what is worse, vast cost of appropriateness, and, what is worse, at the expense of that proper supply of light and air which, according to our modern notions, is most important, not only to comfort, but to health.

The window, above every other architectural feature, should characterise and illustrate the epoch in which it is designed. In all former periods it has done so, and why not now? This may be said to have been the case, even in the very earliest forms of the builder's art, which fitly suit and reflect the rude age for which they were constructed. In some of the primeval monuments of barbaric architecture still in existence, the window is simply that *wind-hole* which is the parent name of the modern term; and in that form it tells plainly enough the story of an era in the very infancy of art of which it is the rude artistic reflex. In later epochs, in the East, for instance, another example may be taken of the accurate reflex of contemporary manners exhibited in the domestic architecture of the period, and especially in the character of the windows. At the period alluded to, the luxuries of modern Oriental civilization, after their kind, had begun to develop themselves; the manufacture of glass had become more or less generally established, and its use adopted in all dwellings of superior class, in which the luxury of more spacious windows was soon perceived when they could be made to exclude the inclemencies of the weather, either by day or night, by a material which did not exclude the light. But a difficulty occurred in adopting the more spacious window, as openings thus increased in size would at once become a far too vulnerable place of attack in a land where countless tribes still exist whose natural profession is that of the robber. To obviate this objection, the houses of the wealthy were built with their principal windows looking into an interior quadrangle or court-yard, often large enough to be treated as a garden, while the external walls had scarcely a single perforation worthy the name of window. Here is a phase in the story of the window which is highly characteristic. It speaks eloquently of political misrule, and, at the same time, of that domestic jealousy which the social institutions of Asia tend to develop and foster. It gives also a special character to most of the Asiatic towns,—an aspect, in the main, desolate and uninviting,—for there are no glistening windows to look down upon and welcome the stranger, nor to reflect the glories of sunrise and sunset, nor to afford those glimpses into the inner life of the dwelling; while all of these effects are such cheerful characteristics of our Western and Northern cities. And, even as those Eastern dwellings meet us with no beaming look of welcome from sparkling window-lights, so, the women of that Oriental town furtively pass those they chance to meet with eyes closely veiled, or with only one cyclop-like orb glancing from its half concealment; and the analogy of the architectural and the human eye establishes itself again.

Somewhat similar phases of domestic architecture and manners to those just referred to existed in Greece and Rome during the earlier periods of their civilization, though modified to some extent by the nature of the freer forms of European institutions. From this and other causes the "window" never became an important feature in Roman architecture, either monumental or domestic. Nevertheless, both in Greek and Roman times, at a later period, there were windows,—true windows,—not merely openings closed at night by the biclores, or wooden shutters, but even decorative windows, in the houses of the rich, provided with regularly constructed framework of wood or metal, in which laminæ of the trans-parent *lapis specularis* were fixed, somewhat after the manner of our modern glass; and eventually glass itself was used, though in very small pieces, as proved by remains of glazed windows disinterred at Pompeii.

But it was not till after the fall of the Roman empire, and the establishment of the modern kingdoms by the Northern races, that the true history of the window commences; and, to understand the origin and development of the modern window, it will be necessary to take a rapid survey, commencing with the very dawn of Celtic civilization. Not glancing casually at various epochs and phases of art, but following out with some degree of consecutive severity the gradual development of the window as a prominent artistic feature in one of the noblest of the fine arts.

The early dwellings of the Celtic and Scandinavian races were, as recent discoveries have shown, of the simplest and rudest description; and whether formed of rough wickerwork, like the remains lately found in the Swiss lakes, or structures still more rude (though made with masses of stone) like some of the older Irish cabins, which may still be seen in Galway and Connemara. These primitive edifices had but one opening; and that aperture represented in itself the door, the window, and the chimney. The separate window, or wind-hole, as a distinct feature, marks a long subsequent stage of the builder's art. Of the wind-hole of this epoch we find synonymous terms in the *ventana* of the Spaniards (which is still the Spanish name of the modern window), and the *venthue* of the Danes, both terms clearly expressing a mere opening without any protection. In the German term, *fenster*, and in the Italian *fenestra*, we find traces of the next stage of development of this important architectural feature, that in which it was protected, as both terms imply, by a network of hempen rope, or a lattice of wire, or more solid metal, as a security against either the nocturnal or daylight entrance of domestic or wild animals, whose uninvited presence had doubtless been found inconvenient, or something worse, in times when wolves and bears were common and even numerous in the nearest woods, which still

covered a large portion of the country. Thus each successive kind of window forms a commentary on contemporary manners and general civilization.

As the forms of modern civilization progressed windows rapidly assumed a more and more important place in European architecture. Its earliest increasings in size and decorative character were, however, in those windows which, as in our Mediæval castles, received their light from an inner court, as in the East, and from partially similar causes. In our early castles, therefore, while yet the external openings were, as a general rule, little more than mere slits in the wall, and used as loopholes for the arrows of the archers as well as for the admission of light, those looking into the courtyard had already become large and decorative features in the general design of the building.

The next step may be most conveniently traced in the walled towns of the Middle and immediately succeeding ages, in which the windows, even of the fronts of the houses, were in an analogous position to those of the castle which looked into the interior court, protected as these town windows were, by the general external rampart, from the missiles of an enemy. Under these conditions the dwellings of towns began to exhibit wider and wider windows, till in the timber-built houses of the fourteenth and fifteenth centuries the fronts became nearly all window. But this architectural arrangement, which destroyed the individual character of the window, did not insure a great abundance of light; for the glass was so green, and the leaden lattice so clumsy and thick, that a room with one entire side all window was still but poorly lighted, according to our present notions of a light room.

In houses of this description the windows of the ground story, or *rez de chaussée*, were almost invariably unglazed, and protected at night by wooden shutters, similar to the Roman biclores; while in the daytime, if wares were exposed for sale in these unglazed windows, they became more strictly *fensters* or *fenestras*, as being invariably furnished with a protective network, no longer as a security against wild beasts or domestic ones, but to preserve merchandise from the unceremonious appropriations of the light-fingered members of the urban population, who appear to have always been a very numerous and active class in every community. The absence of glass and the presence of network are remembered by our grandfathers even in the streets of London.*

* To be continued.

THE PUBLIC HEALTH.

The last report by Mr. John Simon, made by direction of the Lords of the Privy Council, contains a large amount of valuable information, and is one of a series of volumes prepared for presentation to Parliament on the various conditions of the public health.

Amongst other matters of importance, the present state of vaccination has been carefully considered, and the fact is referred to that, in the Grand Duchy of Baden, in eight years, not one single death from small-pox was reported, and, in Copenhagen, no deaths from this pestilent disorder have occurred in thirteen years. In London it killed 2,000 in one year.

To get rid of small-pox altogether, clear evidence shows, all that is needed is an effective system of public vaccination; and it is recommended that there should, for the use of London, be fifty or sixty stations, and no more, all under the regulation of an independent authority, instead of, as now, being under the charge of a variety of persons. It is also suggested that there should be an effective registrar, and law to compel parents to have their children rightly vaccinated. There is, doubtless, much need of improvement in this matter, but, as our readers know, there is at present a law for the enforcement of vaccination, which has for years been allowed to remain a dead-letter.

In connexion with the food of the industrious and poorer classes, Dr. Smith has made extensive inquiry in the metropolis and several districts throughout the country. It is stated, in respect to the food of men and women, that a woman must have for her daily food at least 3,900 grains of carbon, and 180 grains of nitrogen, or as much nourishment as is contained in a half-quartern loaf. A man usually wants about a ninth part more. It appears that, on examining into the conditions of forty-two families of sick, it was found that the amount of food was insufficient; and in thirty-one families of needle-women the amount of nourishment was much below the mark. Farm labourers were also found to be far below the proper standard.

The average cost of a week's food was found to vary in different places, being lowest at Macclesfield. The cost of food for each adult for a week, was from 20d. to 23d. The food in Bethnal-green and Spitalfields was found to be less nourishing than in other places. The London weaver buys his tea and other provisions in the most costly way, providing just enough for each day's necessity. Of all classes, however, the state of the needle-women was found to be the worst.

The account of the food supplied to the labourers is favourable; but from our own careful observation in both town and country, we fear that, upon the whole, many of the accounts have been too favourably given: the pale faces and shrunk limbs of women and children are obvious in the English counties, in the east of London, and elsewhere; showing that, in addition to the evil conditions of the dwellings, there exists a degree of under and improper feeding which is not sufficiently shown in the reports.

The principality of North Wales was found more prosperous than South Wales.

In Scotland the shepherds increase their meat diet by eating the lambs and sheep which die of disease. The use of milk and oatmeal gives an advantage to the Scotch farm labourer. In Ireland Dr. Smith found abundance of potatoes, meal, and milk. When potatoes are plentiful, and used with butter-milk, they form the entire food of the peasantry. The daily allowance at a farmhouse to each man is said to be ten pounds and a half of potatoes, and three pints of milk.

The average cost of a poor Irishman's food is 1s. 10d. a week; of a poor Scotchman's, 2s. 10d.; and about 6d. more for a poor Englishman. The Irishman's food costs about 2¾d. a day, the Scotchman's less than 5d., and the Englishman's about 5½d. a day; and yet Dr. Smith says that the poor Irishman gets the most nourishment, and the poor Englishman the least.

This voluminous report deserves the most careful consideration, and should in some condensed form be placed in the hands of the working classes. In most of the mechanics' institutions and chief libraries of the provincial towns the parliamentary reports have either been supplied, or they might be obtained with but little trouble. Good service would be rendered by those who would condense such reports and put the most instructive portions into the form of lectures.

The information of Dr. Barnes, physician to the *Dreadnought* hospital ship, should meet with attention, so that proper care may be taken of that useful part of our population who chiefly man our mercantile marine. Dr. Barnes says, that nearly half of the men admitted into the sailors' home, at Poplar, are suffering from scurvy at the time of their admission, and that a twentieth part are seriously diseased by it. We seem, as regards the state of a number of our merchant-ships, to be drifting back to the days of Christopher Columbus and Captain Cook. Dr. Barnes remarks that this loathsome and dangerous disease "is seldom met with in the cabin." There should be a careful inspection of every outgoing and incoming English ship, by competent authorities, whose duty it would be to see that fines, &c., in instances of neglect, are duly imposed.

Reference is made to unhealthy trades, especially dressmakers and needlewomen, tailors and printers. In consequence of overcrowding, and other sanitary neglects, the death by consumption amongst tailors and printers is enormous. The mortality of the London printers, between the ages of 35 and 45, is twice as high as that of the male agricultural population.

Mr. Simon reiterates what we have for so long insisted upon, that the effective ventilation of all in-door working places must be made compulsory by some appropriate provision of the law.

The extensive use of opium and such-like drugs is mentioned. Dr. Bristow and Mr. Holmes report on the state of the chief civil hospitals in England, Scotland, and Ireland; and, in connexion with the facts which have been gathered, Mr. Simon says that "hitherto, without exception, the plans for artificial ventilation for wards have been costly and fatal failures: whatever other appliances exist, a ward must be perfectly ventilated by its window."

THE LONDON BAKERS.

It is to be regretted that the new Act for the better sanitary regulation of bakehouses should meet with so strong an opposition from the masters that in several instances it has been necessary for the district inspectors to seek for penalties for breaches of the law before the magistrates. One provision is, that boys under sixteen years of age shall not be admitted to work in bakehouses. On this point there is a good deal to be said on both sides. There are, however, but few boys engaged in this business, which is carried on for the most part by journeymen, many of whom are natives of Scotland, or who flock to the capital from other towns. In many provincial towns, and indeed throughout many country districts (particularly, we are told, in such places as Edinburgh, Glasgow, &c.) the labour of boys is used to a large extent, and there can be no doubt that this is very injurious to health. In London the duties of the bakers' boys are not easy. As we have said, however, there are but few boys employed in the London trade, although the Act applies more especially to them as regards the hours of work.

It is respecting the nightwork of the journeymen that there is the most dispute between the masters and those who have the charge of the public health. Amongst the men, the desire for change is general; and we think it is in a great measure the prejudice which has resulted from long practice alone that causes the masters to object to arrangements which would prove of ultimate advantage to the customers, to the workmen, and to themselves. Many of the more intelligent know this, but they have not the courage to act contrary to the custom.

The majority of the men, many of whom have families supported on scant wages, fear to run the risk of losing their work, and are shy about expressing their thoughts on this subject.

In the course of our experience we have met with so much opposition from persons even of general intelligence and kindly feeling, as to the removal of causes of ill health, or changes in arrangements, which from our disinterested point of view were objectionable and dangerous, and of actual disadvantage to those who were so much in favour of its continuance, that we have ceased to feel surprise at some of the master bakers putting forth arguments which are as much opposed to rectitude as they are to common sense. Some deny that the sleeping in the bakehouse occurs with their knowledge; but an intelligent baker—Mr. Samuel Ayton, of Bermondsey,—says that, "there is not a master in London, performing nightwork, who does not know that the men will get all the sleep they possibly can" in the bakehouse. Mr. Ayton further remarks, that the fact is, that the Legislature, disgusted with the cruel treatment of the *employés*, revealed in the report of Mr. Tremanhere; and finding themselves unable to deal with adult labour, aimed a side blow at the dangerous and pernicious practice of nightwork; and as it may be denied that there is any cruelty in the system, this authority relates his own experience, as follows, merely premising that to his own certain knowledge the treatment of the men at the present moment is far worse than anything experienced even by him; and this we can readily conceive, when we remember the details which we once extracted from a London master-baker's son as to even his own personal hardships, far less those of workmen not so likely to be favoured. The authority alluded to said: "For seven years I worked in London as a journeyman baker. I was compelled to work at eleven at night, and remain there till six the following evening. This was continued without intermission till Saturday, when I was allowed to have my only night in bed in the course of the week. Just think of it: nineteen hours per day for six days running every week! and the highest remuneration I ever received for all this toil was 16s. a week. Can you wonder, then, when I tell you, calmly and deliberately, that sooner than go through that seven years again I would commit suicide? Existence to me, under those circumstances, would not be worth having. Our Government would not dare to work a criminal—a transport—in this way; and yet it is constantly inflicted on honest men." He has been an employer for many years, and declares that there is no actual necessity for this state of things. By commencing at four o'clock in the morning, every baker knows that the bread can be in the shop, ready for sale, at half-past nine; and, says Mr. Ayton, as hot bread is not whole-

ome, —and the same opinion will be expressed
y many medical men,—that is soon enough, in
l conscience.

On inquiry respecting this amongst a number
masters and men, we find that when the case
fairly argued, there is an almost universal
pinion respecting the need for change. Some
ven say that by making an arrangement to
art work at five o'clock every morning, the
aking could be got ready in fair time for the
ay's consumption.

Mr. Godbold, the inspector of bakehouses in
slington, has made night inspections, and found,
s might be expected, a large number of bakers
ho, after the hours of midnight, were sleeping
n sacks. The new Act says that this is not to
e allowed; and that the men are not to sleep
n the premises, unless there are ventilated bed-
ooms sufficiently divided from the bakery by
artitions. At present the inspectors who have
een appointed have a difficult duty to perform.
f they make application by knocking at the doors,
here is plenty of time for the men to be aroused
rom their unwholesome resting-places. Cases
ave been proved which have been evidenced
nly through windows of the bakehouses looking
owards the streets. It is said, however, that
everal of these have been closed at night in
onsequence; and thus a means of ventilation is
topped which adds to the existing mischief.

Mr. Ayton suggests that the bakers expose
hemselves to the visits of the inspectors be-
ause they do not like to have their own sleep
disturbed, or that of their family, by letting the
men in at four or five o'clock in the morning.
But," he says, "let them meet together and
gree to abolish night-work in this trade, and
he inspector would cease to trouble them."

Notwithstanding all that has been said to
he contrary, there is not the least doubt that
in the baking trade great abuses exist which
greatly need remedying: the present arrange-
ments are murderous to the workmen, who are
either destroyed or rendered bodily old before
they have reached their prime. Who ever saw
a journeyman baker old and in good health?
We have asked the age of several men, and
have been surprised to find how youthful they
really were by comparison with their appear-
ance. The records of the Registrar-General
show the high rate of mortality amongst the
journeymen who are engaged in this trade.

If such a system is bad for the men it must
also be bad for the masters; for it is impossible
that any one can do justice to his master's
business when he is from year's end to year's
end overworked and underslept as bakers are.
Nor are the arrangements at present in use good
for the bread consumer. The practice of men
sleeping and lounging for hours without change
of clothing, and, too often, without proper atten-
tion to cleanliness; the neglected and filthy
state of many bakeries; the gross adulteration
of the staff of life, &c.; are *all* also bad for the
customer. It would be to the interest of bakers
to show to their customers, or to be able to
certify, that their premises are in a wholesome
condition; and good would be done if the con-
sumers of bread were to see to this themselves,
and refuse to deal with persons who do not con-
form with the regulations. If, however, the
agencies at work are not sufficient, the Legisla-
ture must, by increased power given to the
inspectors, enable them to enforce right regu-
lations.

THE EXPLORATIONS AT KEISS.

These explorations, by Mr. Samuel Laing,
have been successfully continued, and a great
many interesting facts and still more interesting
relics brought to light. Mr. Laing, we learn, is
to lay the results of his researches before some
of the scientific societies of London; and it is
his intention, if opportunity should offer, still
further to prosecute his researches into the pre-
historic condition of the county of Caithness
when he returns to the North next summer.

The mound on the seashore behind the village
of Keiss has been now thoroughly explored and
completely excavated, disclosing the foundations
of a large circular building, of the class called in
Caithness Picts' houses. A number of bone and
stone implements, consisting of arrow-heads,
pins, &c., have been found in this mound, and
in the one near the old churchyard. There is a
singular fact connected with this one at the
churchyard. The foundations of the structure
rest upon a mound, or kitchen-midden, of shells,
largely mixed with bones of animals, pottery, and
bone and stone weapons, &c. This mound is of im-
mense size, having been traced for some 20 yards,
and it is at least 7 ft. deep. The fact of the
foundation of what must have been a Picts'
house resting upon the top of this mound seems
to assign to the shell-mound even an earlier date
than the Picts' houses, though they are of very
great antiquity.

A complete churchyard, if we may so call it,
or at least burial-place, of the men of the stone
era has been discovered, the mounds or cisted
graves running in a line, and separated from
each other by intervals of five to six paces.
Stone implements have here been found in
abundance. Some of the skulls have small
holes, as if drilled, in the hinder part, and in
one a bodkin was found sticking. Was it thus
that feathers or other ornaments were fixed on
their heads, or the hair itself adjusted by the
fixed bodkins? Among the graves was found
one of a very superior kind, which Mr. Laing
thus describes:—

"I have found the central tumulus apparently of the chief of the tribe, which consisted of a stone cist like the others, but more carefully and massively built, which was buried under a large cairn of heavy stones, from the beach, the whole being inclosed in a solidly-built circular wall, 22 ft. in diameter, and 9 in. to 1 ft. thick. In this cist was the skeleton of a man, who had been about 6 ft. 5 in. in length, and of most massive proportions, but with a comparatively small skull, of a type similar to that formerly described, though of superior conformation. The skeleton lay at full length, reclining on the right side; and in the cist by its side were about a dozen stone weapons of the very rudest possible form."

This great chief could not have been one of the
little people whose remains have been so often
found.

In the kitchen-middens, along with jaw-bones
of animals were found also human jaw-bones,
without any trace of the remainder of the skele-
tons; and Mr. Laing infers that our respectable
forefathers of this period may have been
cannibals!

THE ANTIQUARIAN DISCOVERIES AT BRADWELL.

A meeting of the Essex Archæological Asso-
ciation has been held on the site of these dis-
coveries in Essex, on the seashore, at Bradwell,
one of the extreme points to which the land of
the county extends. The purpose was to examine
and illustrate the remains, evidently of a very
early period in our history, which the works of
the Essex Land Reclamation Company have been
instrumental in bringing to light.

For the purposes of this company excavations
were commenced on the side of a field, at one
end of which stands a curious ecclesiastical-
looking building, supposed to have been connected
with the lost city and military works known
as the chapel of St. Peter's-on-the-Walls, but
now used as a barn; and while antiquaries
had been looking ont at sea for the site of
Ithanacester, and tradition asserted that in our
grandfathers' days ruined pillars were to be seen
there at low water, the navvies laid bare part of
the foundations of important buildings on the
dry land. Happily this came under the cogni-
sance of Mr. J. O. Parker, the owner of the land,
who at once had men set to work to make exca-
vations higher in the field, whose labours soon
laid bare other parts of the massive walls of
what had evidently been a considerable fortress,
and enabled its shape to be traced. The site of
a Roman camp was also shown by the discovery
of various articles.

It was to view these relics and investigate
their historical bearing that the meeting was held.

The company first assembled in the building
alluded to—the popularly known chapel of St.
Peter's-on-the-Walls,—and here Mr. J. O. Parker
gave some account of the discoveries. In course
of his remarks he said,—

"So far as the foundations can be traced at the present day the station would seem to have comprised an area of about three acres, defended towards the land on its southern, western, and northern sides, by walls of enormous thickness, and with an external fosse now nearly filled up. On the seaward or eastern side it would appear to have been open, like Richborough, or at all events not inclosed by a continuous wall of masonry. Such excavations as have recently been made would seem to favour this notion. They show no continuous line of foundations on the eastern side, but they have, nevertheless, brought to light abundant evidence of the rude encampment of the Roman soldiery."

The Rev. F. Spurrell then read two papers,
one titled "Notes on the Early Building on the
Shore commonly called the Chapel of St. Peter
ad Murum," and the other, "Notes on the
Roman Remains at Bradwell-on-Sea."

The various articles that had been obtained
from the excavations were then examined, and
this closed the proceedings in the chapel.

The company then visited the excavations, and
afterwards returned to Bradwell; and, after a
glance at the village church, which is under re-
storation, the party sat down to dinner, at the
King's Head Inn, Mr. T. Sutton Western, pre-
siding.

A paper by Dr. Bell was to have been read,
"On the Nomenclature of Ithanacester, and its
identity with the Othonæ of the Notitia Utriusque
Imperii, cap. 71," but this was not done.

STONEHENGE.

The remark of your correspondent, "W. B."
that "the large blocks have a grain of marble,"
corroborates the evidence given in the following
extract from the first edition of the "Parlia-
mentary Gazetteer of England and Wales,"
published about two-and-twenty years since, by
Messrs. Fullarton & Co., and of which work I
am the author:—

"The materials of Stonehenge have been described as consisting of three sorts of stones; * silicious grit forming the outer circle and the trilithons; green granite [syenite or greenstone] forming the small uprights; and micaceous grit, 'which strikes fire with steel, and contains some minute spangles of silver mica,' forming the altar or hearth-stone. And it has been supposed that the first must have been brought from the vicinity of Marlborough, and the second from Dartmoor; but where the third came from has not been decided. At a late meeting of the Archi-tectural Society of London, † however, the president stated that, on a recent inspection, he had ascertained the curious and interesting fact that *the large stones are of pure white foreign marble* (!) *regularly wrought in primate blocks;* that the discolouration is only superficial; pro-duced, like the irregularities of shape, by the weather; and that the granular character within is closely analogous to that of Carrara, obviously not Penthelic.

This not only opens a wide field of conjecture respect-ing the means by which they arrived at their destination; but appears to lend some countenance,—lating the mar-vellous of course,—to the ancient tradition of 'the wondrous voiage that Marlyn made into Ireland to fetche theise stones; the bringinge of the same before out of Africe into Ireland by Gyauntes; the vertue of the stones theimselfes, and the art of the prophet [Merlin] in re-movinge them when no force could prevayle; and such other thinges which Jeffrey of Mounmouthe at large dis-courseth.'

If they have now been clearly proved to be foreign ‡ [illegible] we certainly feel more inclined to fall so far back at once upon the ancient tradition, than to agree in opinion with Mr. Clarke, the able president of the Society above named, that they may have been brought here by the Phœnicians direct from Greece. ‡ Mr. C. also suggests that they were probably introduced into this country by Southampton water, from the upper navigable point of which there only remained a distance of 23 or 24 miles of land carriage to be overcome in conveying them to their present position; and that the expense and labour thus under-gone to obtain stones of a white aspect for the great Druidical circle tends greatly to strengthen the hypothesis that the arrangement was connected with the worship of the sun or moon."

I may here observe, however, that as the
ovates or novitiates were dressed in green, and
the Druids in white, the smaller green stones,
and the greater white ones, may rather have had
relation to these than to either sun or moon.
Moreover, Hu or Hee, "the glorious god of the
two origins," terrestrial and celestial, and who
spoke in the god possessed, was the true Druidical
Sun. Thus, in the Taliesin records, we find Hu
speaking, even while described as a sun:—

"In the sacred course, on a serene morning, when Hu sent forth his dancing beams, making this demand: I require men to be born again, in consideration of those liberal ones [those liberated ones?] who will be [who have been?] lost: those *blessed ones*,—they have been intoxicated and lost."

Those spoken of as having been lost appear to
have been the "children of the evening," the
Gwyllion, night wanderers, fairies, or witches,
who "sang the night songs" of the god.

The stone to which the Rev. Prebendary
Scarth alludes, as "apparently intended to direct
observation, at the summer solstice, to the
point of the rising sun," may have been so
intended, and yet Stonehenge, for all that, may
not have been "a temple connected with *solar*
worship;" for we see, even from the brief quota-
tion just given, and there are other passages in

* The word "sarcen," used by the Rev. Prebendary Scarth, simply means "a stone drawn from the native quarry in its rude state."

† The predecessor of the Royal Institute.

‡ And thus, too, may be reconciled the apparent incon-sistency of various probabilities with the ancient tradition that great stones were brought hither from Ireland to commemorate the massacre of the British nobles by Hengist and his fellow traitors. For, as it is the large stones alone that appear to be of foreign material, the tradition must apply to these alone; and it is therefore after all probable, as the appearance of the other stones long since suggested, that they had stood in their present positions *previously* to the addition of the larger, as a reno-vation and improvement of the more ancient circle, on a greater scale. The fact, at all events, that Hengist here called the conference before alluded to seems to show that this vicinity had been previously adopted at least for *state* purposes, if not,—as the great stones and barrows were said to be commemorative of the dead, for *sacred* purposes also. *Note in Parliamentary Gazetteer.*

a

the records of a similar kind, that *sunrise* was specially, even if emblematically, alluded to in connexion with the worship of Hu or Hee, who, though their *solar* god, was not the *outward* sun.

The idea which has prevailed that the outward sun was an object of worship among various nations may be correct as regards the drivelling senility of religion, or superstition, into which some such nations may at length have merged; but that, at a previous time, all of these nations knew better, there is strong reason to believe. Thus, the *winged sun*, Ferocher (Pharaoh?) Lord, or Guardian Angel, of Egypt, appears to have been identical with god-possession, or "the blessed life of the gods," of which Iamblichus speaks, and with the Hebrew "*Sun* of righteousness, . . . with *healing* in his *wings*," who *rises* on and in the regenerate, or the "born again,"—as with the Druidical Hu or Hee of the "dancing beams" and the "serene morning" himself; and identical also with the "Day Star" or Sun of the Christians, which "arises" on men's "hearts."

That at least the more enlightened in heathen nations perfectly well knew the distinction between the *Sun* they worshipped and the outward sun I may here give just one curious proof, among the many which might be adduced. In *The Asiatic Journal* of Bengal, vol. 17, page 69, is a translation, by the Librarian of the Society, of a Mythraic inscription at Udayapur, within the Bhopal agency, which was copied by Captain J. D. Cunningham, and is thus given:—

"Inscription from the Vijaya Mandir, Udayapúr. This is a Mythraic hymn.

'OM! Salutation to Savita! We worship the luminary who is an enemy to darkness, who shines and destroys the strong shackles [attraction] of this revolving earth . . . . [a poem] composed by me, who, though weak-minded, am zealous, and was *inspired by Him who dispenses heat** and is able to develope our intellect. O *Sun!* the *moon*, having imbibed the rays of thy reflected light, attained her wealth of the *health-promoting* herb [the moon plant] which produces Amrita (nectar when *offered* in oblation *to the Fire*, which Amrita, again, is sought by the gods: therefore, I say, verily thy greatness is inconceivable. Thy visible rays are liable to destruction, but thy invisible rays are eternal: therefore thy rays are twofold. O Lord of Light! we salute thee. Thy invisible rays are atomic, and the cause of our soul [of our spirit?] and the visible exist in the form of the creation. He who, by eradicating worldly desires, *becomes* the source of conferring happiness [becomes the god?], and like a billow plays on the ocean of intellect, purified by knowledge and meditation, can be somewhat appreciated only by the devout. *That* pure Light positively is the great Brahma, which shines in the *Heavens*, and is the cause of the happiness of this passing world. *He ignorant* [lit. film-eyed] *believe him to be the light that is seen*, but the learned (lit. clear-sighted) know *the quaffer of minds* to be *the Great M. J.* He who knows thee to be *the life of the world*,† or the world a part of thee, is a learned [gnyani]; but he who thinks otherwise is a dunce. Ye cowards, infatuated by worldly passions, and ever actuated by delights, ye take not His protection: why not, by worshipping him who is a bar to misfortune, approach to the Contented Commander,‡ who leaves you a wide door open to the stronghold of salvation. *He attains to the Sun who prays the Sun*, orally and mentally, and performs virtuous actions."

The ovals within the inner circles at Stonehenge seem to be regarded by some as having relation to the ellipticity of the earth's orbit; but it must be recollected that ovals had quite another meaning in heathen mythology. The candidate for initiation often passed through an oval, whence he was born again, as from the womb of his Great Mother: and of the initiate it was said that they were "twice born," or "first born in the egg [or oval], and next born out of the egg;" or, as Hierocles in his Golden Verses taught, they first became men and then became gods. Such were the ovates (as men) and the bards (as gods) among the Druids. In this view, the Fire-striking altar stone within the central oval was doubtless "the stone of power" (as in "the circle of Loda") "the prophetic stone," or "Bedd" of the goddess or Great Mother, on which the ovate lay, in the entranced and inspired state, as a bard, an Apollo, or an Oracle, and from which god-possessed state of mystical life-in-death he was resurrected, or "born again," into "newness of life," as an initiated Druid.

The idea of Mr. Scarth that the *outermost* circle represents a *crown*, reminds one of the concentric circles called the Hebrew Sephiroth, or Celestial Splendors, the *outermost* of which circles was called the *Crown*,—that is, the Crown of Splendor,—the Crown of Glory.

It is a singular circumstance, stated by Inigo Jones, as I find quoted by me in the "Parliamentary Gazetteer," that the cover of a thuribulum, or incense-cup, was found within the area of Stonehenge; and that Stukeley states that a tin tablet was found there in the time of Henry VIII., inscribed with many letters, but in so strange a character, that the most learned antiquaries of the age could make nothing out of it. Some, he says, called it, Punic, others Irish.

Stukeley, I may add, dug close to the altar of Stonehenge, and, at the depth of a single foot, came to the solid rock. Others have also excavated there, but also without any special discovery. The stone, however, does not appear to have ever been lifted; and, if there were any records or relics beneath it at its placement, probably such records or relics are there still.

JOHN E. DOVE.

* "The Lord God is a *Sun*," and is "like clear *heat* upon herbs."

† "The life of all that are in the world" is precisely what the Druidical sun, Hu, is called.

‡ *Vide* Plato.

FRANCE.

AT the Bercy station of the Lyons line, on the 28th ult., a locomotive engine shunting an empty cattle-train backwards by too violent a movement, sent the last two waggons through the end buffers of the platform and the parapet of the bridge over to the boulevart. It took several hours to clear away the *débris* of the trucks, which filled up one of the arches and put a stop to the circulation. This happened at 11 p.m., and happily no one was injured.

On the 29th ult. the celebrated Admiral Romain Desfosses was interred with military honours at the Invalides. In 1845-46 he executed a hydrographical survey of the island of Bourbon. Appointed in 1859 commander-in-chief of the Mediterranean squadron, in the month of November of the same year he dismantled the Tetuan forts on account of their insult to the French flag.

The Prefect of the Seine has received a petition, signed by the most influential merchants, agriculturists, and corn factors, praying for the erection of a Corn Exchange in Paris, somewhere near the Halles Centrales.

M. Chatel has discovered in the numerous tumuli on the summit of the Bois de Valcongrain (Calvados) abundant traces of incineration, calcined bones, charcoal, &c., and a quantity of hand-dressed flints and a stone hatchet. He has also traced the remains of a *cromlech* of circular form connected with a long avenue of Celtic stones.

SPAIN.

London to Madrid direct.—A few statistics relating to the Great Northern of Spain may be interesting to our readers. The main engineering difficulties of the line were comprised within the thirty miles, as the crow flies, between Beasain and Olazagutia, the extreme points of the pass. It took eighteen months to construct this last bit, upon which were concentrated an army of 12,000 labourers, including miners from Piedmont, carpenters and masons from France, and navvies from Aragon and Castile. Of the latter there were 5,000; of miners, 3,000; stonemasons, 1,000; quarrymen and stone-cutters, 1,000; smiths and metal-workers, 400; waggoners, 400; and of the class "labourer," 1,000. Villages were improvised in ravines and on the mountain slopes, with hundreds of stables for mules, and sheds for carts and waggons. Storehouses had to be built and filled with provisions of all kinds; nor were hospitals forgotten, in the event of casualties. To blast those thirty miles of granite, limestone, marble, and sandstone, and boulders big as cathedrals, it required 14,000,000 lb. of gunpowder, chiefly imported from England, and to fire the trains of the mines 2,250 miles of slow-match. England and France also contributed 12,000 tons of coal, 12,000 cubic mètres of timber, 2,000 tons of iron for the viaducts, and 1,000 tons for the tools. There were also brought into requisition 20,000 shovels and picks, 460,000 planks, and 3,000 barrows. The gradient between the two points above mentioned is 15 millimètres per mètre, or about 1 ft. in 330, or 16 ft. per mile in round numbers. At Olazagutia, the traveller has attained an elevation of 3,000 ft. above the sea level. We are indebted to the Madrid correspondent of the *Star* for these particulars.

The Madrid Water Supply.—Formerly the water supply of Madrid was as defective as is its drainage at the present time. It is now copious, and the element is pure and excellent in quality. It is derived chiefly from the Guadarrama mountains, a range visible from the terrace of the Queen's Palace, and distant about thirty miles from Madrid. At a point called Ponton de la Olivia, and at an elevation of some 10,000 ft. above the sea level, a dam was constructed across a gorge so as to intercept one of the sources of the Manzanares.

At about two miles from Madrid an enormous reservoir was established, into which the water is conveyed by aqueducts and pipes. Thence, conducted through other pipes of large calibre, resting on blocks of granite, it flows under the streets of Madrid, in sub-ways easy of access from above, well ventilated and lighted, and is thrown, by the simple force of its own power of ascension, to the very tops of the highest houses. The splendid fountain at the Puerta del Sol, the jet of which when full on is 200 ft. high, with a circumference of 6 in., is fed by it, as are the numberless "taps" from which, by means of hose and nozzle, the streets are watered and cooled. The system of works established for the collection of the water and for its distribution was commenced in 1853, under the direction and after the plans furnished by his Excellency Don Lucio del Valle—the Government engineer—and was completed in 1861. These works are on a colossal scale. Others are in progress,—a second reservoir, opposite to and as capacious as the one already referred to, being in course of construction.

THE FINGERS OF TIME.

THE hand of Time has many fingers, which are working, some by quicker means, others by slower; but all equally sure to destroy the labours of man. The salts and acidities of the atmosphere, the pelting of winter and summer storms, the changes in the temperature of the atmosphere, and other matters of a similar description, are important elements of decay. To fight against their external action is a constant endeavour of the custodians of buildings of every description; to defend the woodwork by periodical coats of paint,—to maintain the roofs, and keep the action of the weather confined to the outside, is an important duty, which, if not attended to, leads to rapid destruction. See, for instance, many of the picturesque and noble castles of Scotland, and extensive structures in many parts of England now, where the roofs have been permitted to fall in, the glazing of the windows has failed, and the weather been allowed to play in the richly-carved and finely-fashioned apartments. The glory has departed; and, with a rapidity that seems most surprising, the once stately fabric becomes a mass of shapeless ruins.

There are, however, many causes of decay, especially in dwellings in towns, which are but little noticed. Amongst these are the discharges that, with the sound of a volley of rifles, are made upon doors by footmen and the postman, which cause the ornaments to dance upon the mantel-pieces, and the plasterwork to tremble and shiver. There is also the banging of doors,—an abominable practice, which should be especially avoided by ladies. The movement of many feet in the ball-room, however "light and fantastic" may be the toes, is a cause of wear and tear. The passage of heavy carriages moving quickly on the adjoining pavement, and the trembling of the earth in the vicinity of underground and other railways, are the means of loosening the cement and other work. Inside dwellings of the ordinary kind, especially many of those in the metropolis, the processes of cleaning lead to the rapid wear of woodwork, which the constant wetting and rapid drying, especially in the summer time, cause to split in all directions. In tenemented dwellings, especially, these act on the ceilings, and, together with the constant movement of feet and various shocks, cause them to be rent and marked in a map-like manner, and eventually to fall and expose the lathwork. The busy fingers of mischievous children also do their work, picking holes in the walls, removing the handrails, and often stopping the closets and drains, by attempting various experiments. The children must not be altogether blamed for this, for there are careless or ignorant housewives and servants who are an incessant source of mischief, stopping up the sinks with tea-leaves, house-cloths, and many other matters, and leaving the water-ball unattended to: by these means either depriving the place of water, or flooding the basement in a way which injures the foundations;—and of all the sources of damage to dwellings there are none more serious than damp and the effect of insufficient drainage. In consequence of bad and insufficient drains colonies of rats tunnel through the basement, and in time undermine the premises by their incessant sapping. Mice, in their

y, are a source of mischief and annoyance. the night time, when sleep does not come adily, they may be heard noisily scampering the plastered partitions or gnawing at the irting-boards, carrying out, perhaps, according their views, a principle of ventilation, or aking places of ingress and egress for themlves and families: these little creatures thus do uch mischief.

The "dry rot" is swift and terrible in its ect, eating through and rendering rotten an incredibly short space of time the most assive beams, and spreading in all directions; ten, provided that right measures are not ed, setting the labour of years at defiance. On oking around, the observing eye sees hundreds other agents which are the sure means of aking the present pass away. It is, however, principle inherent in human nature, to fight gainst the ravages of time as much as possible; id praise and honour are due to those who ear substantial and beautiful buildings, which ay stand in their integrity before the eyes succeeding generations.

OLD ENGLISH HOUSE BURNINGS.

While lately making an examination of the ocal histories of several provincial towns, we ere struck by the numerous accounts which ppeared of raging fires that had in some inances almost entirely destroyed the dwellings. n Banbury, there were several great fires: at tratford-on-Avon, there is the same account; s there is, too, at Aylesbury, and many ther places. The general spread of fires, parcularly in the reigns of Queen Elizabeth and ames I., is noticeable. At Stratford-on-Avon, n the 36th & 37th years of the reign of the Queen,* two dreadful fires occurred, consumng 200 dwelling-houses; and in 1614—only wo years before Shakspeare's death,—another re there is said to have consumed fifty houses n less than two hours.

The cause of the numerous fires happening in o many English country towns during the reigns f Elizabeth and James, may, we think, be partly found in the great changes which were aking place then,—as there are now—in the ondition of the country. At the Reformation, numbers who had been associated with the relious establishments, and also many thousands f the armed retainers of the nobility, were riven to find fresh sources of employment, and devise new kinds of industry; and this would naturally have the effect of forcing the people into the towns; and, for their reception, there were provided ill-built and inflammable cottages, which were little better than hovels, with walls of wattle and roofs of thatch.

As regards the timbered houses of a substantial kind, roofed with tile or slate, there is plenty of evidence to show that they escaped when all around had been destroyed; but from the thatch, especially after a hot season, by the touch of a spark in a few minutes there was produced a power of flame which spread like wildfire around.

Out of the evil there arose a certain amount of good; for, from time to time, as calamities occurred, dwellings were reared in a better manner: a fire-watchman was set on some tower, to give speedy warning of danger: water-buckets were placed in the churches; and means used to keep in order pools and streams of water that might be convenient in case of fire.

We have been led to make these brief remarks, in consequence of having noted with pleasure the satisfactory change that has now taken place in many of the country towns, which have entered into rivalry with each other as to the best means of preventing loss by fire.

The system of protection from fire in villages and farm steadings requires also to be considered. By a little foresight much mischief might be prevented in most farms. Water, with very little trouble, can be placed conveniently for use, and a length of hose might be provided at small cost.

In connexion with villages and very small rural towns, it is worth while to remark, that the improvements in the arrangements of the metropolitan fire-engines, have rendered the parish engines next to useless; and many of these might be disposed of with advantage in such situations as we have indicated.

* At this time the population of Stratford-on-Avon did not number so many as 1,000.

GROCERS' HALL COMPETITION.

The Court of the Grocers' Company having determined to rebuild their hall, on their land in Princes-street, near the Bank, invited six architects to prepare designs for it, proposing to present each of them with the sum of 100 guineas, upon receipt of his plans, with specification and estimate, and to entrust the erection of the building to the author of the approved design. The dimensions of the several rooms required, and a block plan of the oddly-shaped plot of land available, were furnished to each competitor. The following architects accepted the invitation, and have furnished designs:—Mr. E. M. Barry, Mr. Blomfield, Mr. Boulnois, Mr. Currey, Mr. Penrose, and Mr. G. G. Scott. The designs are now before the court for consideration. One great object sought is the appropriation to building purposes of as much as possible of the Princes-street frontage, in conjunction with the estate in the Old Jewry, after providing an appropriate entrance to the Hall.

Amongst the, wisely, very few instructions given to the competitors was the requirement that the scale for the plans should be $\frac{1}{8}$ in. to 10 ft., and for the elevation and section 1 in. to 10 ft. Even this, however, we are told, has been departed from by one of the architects. The proposed outlay is about 60,000*l.*

DRINKING FOUNTAIN FOR BARBADOES.

A Gothic drinking-fountain has been executed by Mr. T. Earp, sculptor, from the design of Mr. J. F. Bentley, architect, for Bridgetown, Barbados. Inclusive of the steps and bases (2 ft. 8 in.), to be constructed abroad, it will stand 24 ft. in height. It may be described broadly as consisting of two parallelograms of Portland stone, one on the other, terminating with a pinnacle of red Mansfield stone. Allegorical figures in bas-relief of the cardinal virtues ornament the four sides of the base, and beneath these figures are appropriate maxims in Gothic characters. Surrounding the jet, which is on a bronze cistern-guard, are placed Bishop Ken's well-known words, "Praise God, from whom all blessings flow;" and immediately overhead is a figure of Temperance, with the maxim, "Be sober-minded." Surrounding the lower end of the base are the words, "This drinking-fountain was presented to the city of Bridgetown in the year 1864, for the benefit of thirsty wayfarers." The second parallelogram has green marble columns at the angles, and in various parts of the whole are marble and porcelain inlayings. The forms generally are somewhat "lumpy," but as a whole the fountain merits praise, and will adorn its site.

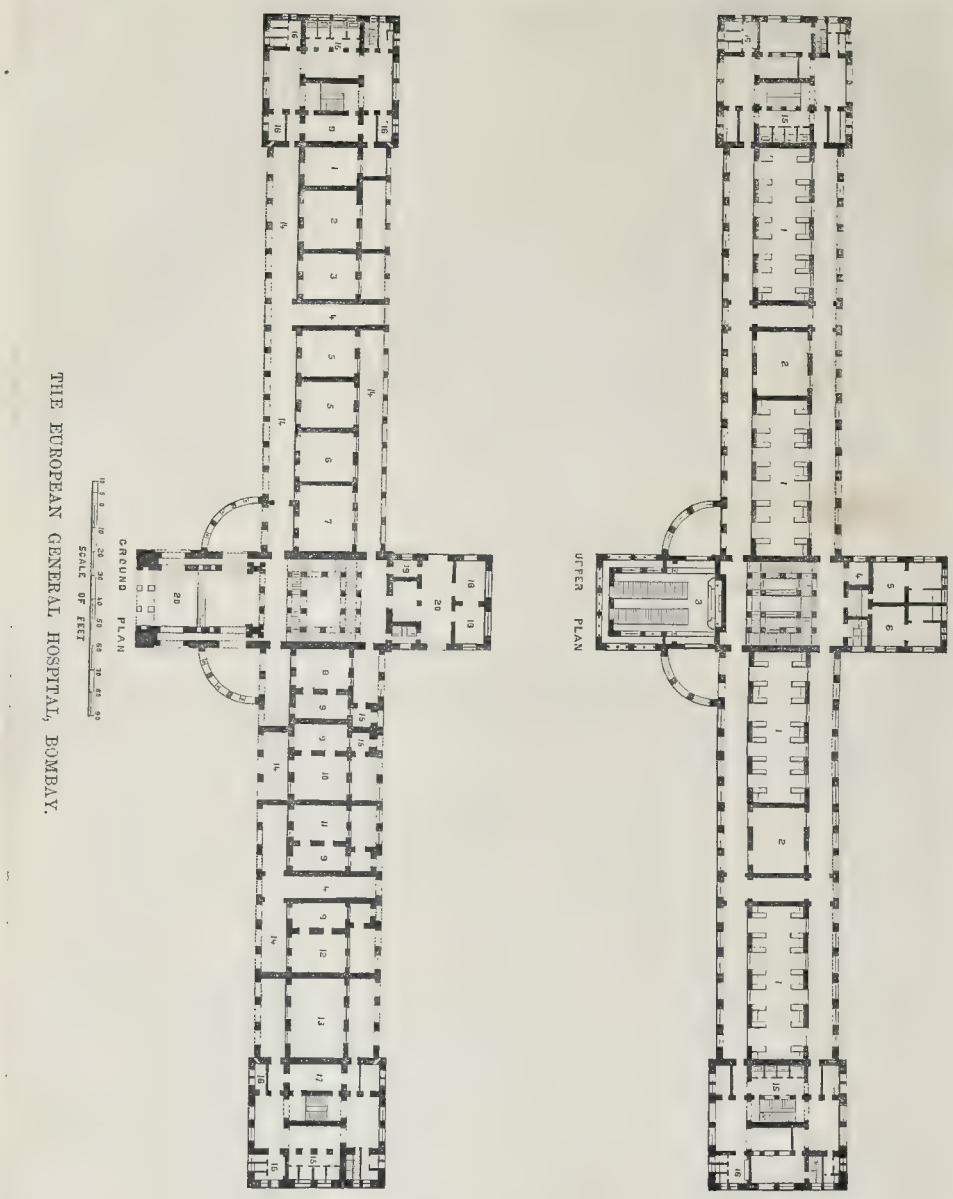
THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

His Grace the Duke of Cleveland has signified his acceptance of the office of President of the Association for the ensuing year. The congress has been fixed for the last week in August, to be held under the presidency of his Grace, at Durham. The president has favoured the Association with an invitation to his seat at Raby Castle. This noble and interesting historical monument, which will be illustrated and described by the Rev. C. H. Hartshorne, with the cathedral at Durham, and other famous landmarks of history in the north, promise a more than usually interesting meeting.

SCHOOLS OF ART.

The Coventry School. The annual exhibition of drawings of the students of this school has been held. The drawings are reported to be of a high degree of merit, those of the ladies especially showing most praiseworthy proficiency, and being far superior to any produced by them on former occasions. The annual meeting of the subscribers and friends was held at St. Mary's Hall, and was well attended, many of the principal inhabitants being present. At the twentieth annual meeting for the distribution of prizes, it was stated in the report that the number of local medals attained at the last examination was 15, and of national medallions, 4. This was the result of five months' work, in place of twelve. The school has again received from the Government, on account of the national medallions of last year, works of art to the value of 30*l.* The number of pupils has largely increased during the year. The number attending the afternoon and evening male classes is 104 against 73 last year. Evening ladies' class, 10; and the ladies' class 38, against 28 last year. The number of boys in the public schools who were examined last year was 107, of whom 79 passed. The least satisfactory feature in the report is the fact that the financial deficiency now amounts to about 127*l.* Votes of thanks to the head master, Mr. Anderson, and the second master, Mr. Frost, and to others to whose exertions the school has been indebted, were passed at the meeting.

The Gloucester and Stroud Schools.—The authorities at South Kensington have paid a compliment to the students of the Gloucester and Stroud Schools, having communicated their wish to purchase six of the works sent up for the last national competition, with a view to their being sent as studies to other schools. The works selected from the Stroud School are a painting of a begonia and a design for ecclesiastical hangings, by Miss Emily R. Stanton; a drawing of a bird's nest, by Miss Rose E. Stanton; and side and end elevations of the Great Western Railway Company's locomotive "Theocritus," by Mr. F. H. Davies. The selected works of the Gloucester students are an outline of plants by Miss Fanny M. Francis, and a study of historic ornament by Miss Kemp. The Misses Stanton, having regard to the benefit conferred on the country by the Government Art Schools, have kindly offered to present their works gratuitously to the Department.



THE EUROPEAN GENERAL HOSPITAL, BOMBAY.

It may be remembered, that early in last year premiums were advertised for designs for this building. The design of which we now give illustrations was one of those submitted in competition. The judges, in the first instance, reported that none of the designs submitted fulfilled the whole of the conditions of the competition, and consequently they could not proceed to award the premiums; upon which the Bombay local government instructed them to place the designs in order of merit, and to apportion the prize fund among a certain number of the best of them. This was done, and the first place was awarded to the design marked "Honor alit artes," by Capt. Wilkins, R.E., of Bombay; and the second to that marked "Koh-i-noor," by Mr. T. Roger Smith, architect, of London. At a subsequent period, however, it was decided to carry out, with a few modifications, the design marked "Koh-i-noor," and our illustrations show the building as it is proposed to erect it.

The ground-floor is raised 3 ft. above the level of the surrounding ground; and this story, which has a clear height of 14 ft., is devoted to receiving, dispensing, and accident wards; living, sleeping, and bath rooms for various officers; and to other similar services.

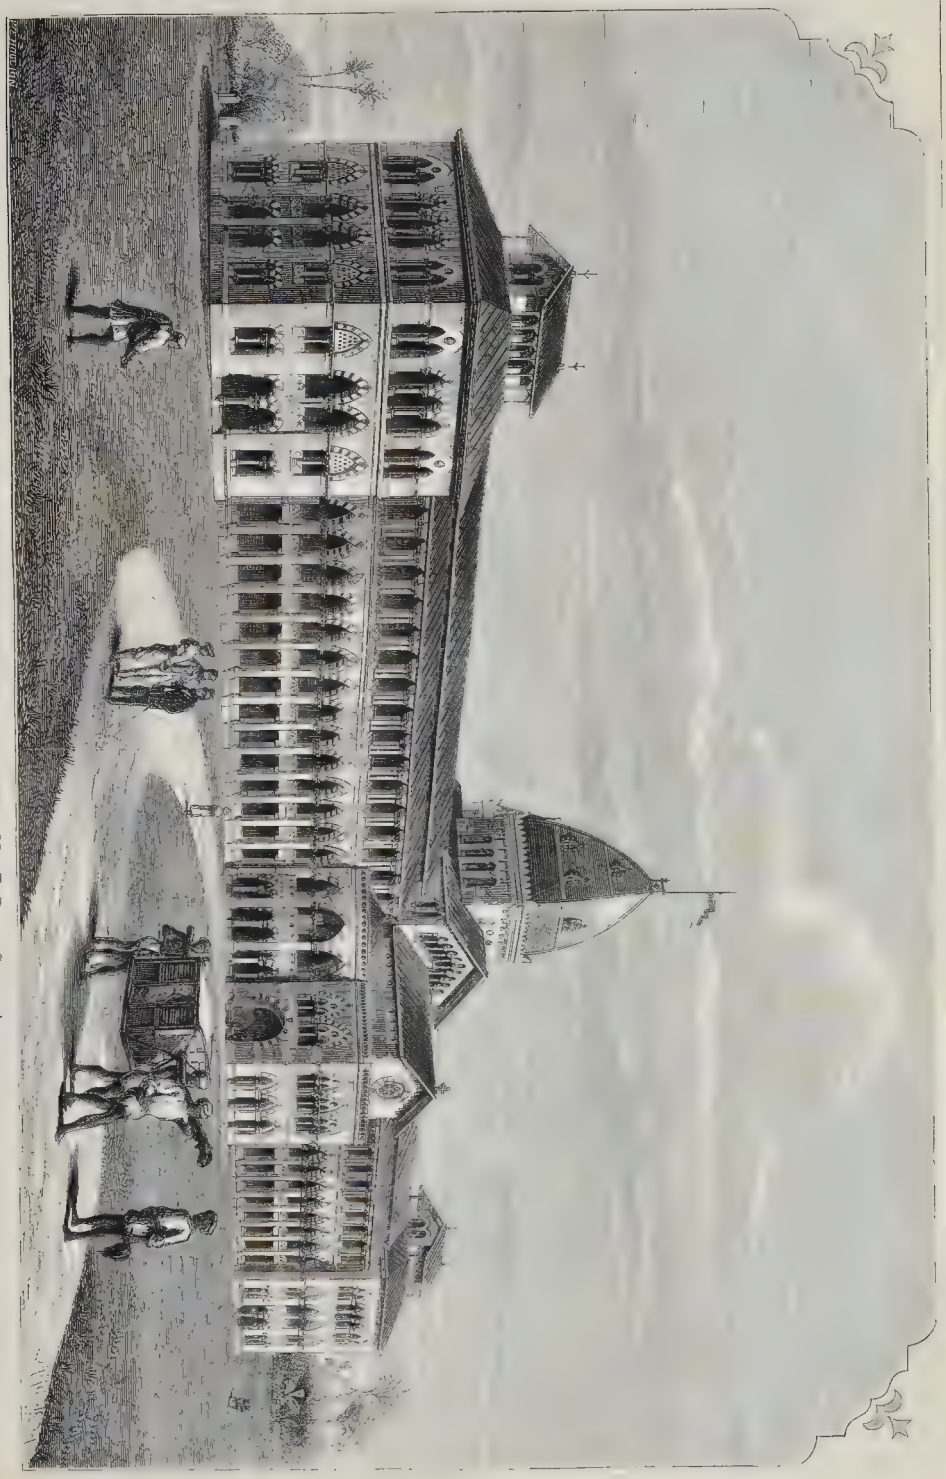
The two upper floors have a clear height of 18 ft., and contain the wards (which are—on the first-floor, 28 ft. 6 in., and on the second-floor, 24 ft. wide). On the first-floor, over the *porte-cochère* is placed the chapel, forming one limb of a kind of transept, while at the back the other limb of this transept, on the same floor, is occupied by the operating-room and nurses' rooms. Over these, on the upper floor, is placed a residence for the house surgeon. Adjoining the accident-ward and operating-room, and placed centrally with regard to every part of the establishment, are two hoists; one for patients, and a smaller one for provisions, &c. The kitchens and offices are to be detached buildings, with covered communications. In front of all inhabited rooms, front and back, stretches a verandah (or loggia), 10 ft. wide, as solidly constructed as the building itself. Portions of this will be made use of by the attendants, and hence the ward, scullery, and nurse's room, found essential in European hospitals, are not needed here. At each extremity a series of baths and lavatories are constructed, and separated from these by a wide space, with a free current of air always playing through it, are placed the conveniences. The entire frontage of the building is a little over 500 ft.; and the height, from the ground level to the ridge of the roofs over wards, is 66 ft. Most of these arrangements, and many of the actual dimensions, were fixed by the medical officers of

THE EUROPEAN GENERAL HOSPITAL, BOMBAY.

the establishment, and a plan embodying them formed part of the instructions issued to competitors.

The ventilation of the wards is carried on by the windows, which are very lofty, and placed opposite each other. The lower part of each window has casements acting as doors. The upper part has casements hung at the bottom to transomes, and opening inwards. Ventilating openings are also provided close to the ceilings. In each window frame there are hung, not only glazed casements opening inwards, but also casements, filled with Venetian blinds, opening outward; and it is also proposed to supply means for closing, when necessary, the outer openings of the verandahs. The building will face the west, from which quarter a pleasant sea-breeze blows daily during a great part of the year; but it is necessary to be provided with means for shutting out both wind and rain during the monsoon.

The structure will be principally of stone, but with internal walls in brick. The floors are all to be fireproof, and the staircases stone. The calculations for the ironwork have been made by Mr. W. Stent. The woodwork, which is reduced to a minimum, will be in teak. The building, the foundations of which are in hand, will be carried out under the superintendence of Mr. James Trubshaw, the architect to the Rampart Removal Committee, Bombay, from the designs of Mr. T. Roger Smith.



REFERENCE TO PLANS.

GROUND FLOOR.

1. Hospital sergeant's room.
2. Hospital stores.
3. Surgeon's room.
4. Passage.
5. Apprentices.
6. Dispensing-room.
7. Receiving-room.
8. Assistant-Apothecary's room.
9. Bed-room.
10. Apothecary's room.
11. Steward's room.
12. Matron's room.
13. Female ward.
14. Verandah.
15. Baths.
16. W.C. and lavatory.
17. Waiting-room.
18. Accident ward.
19. Lift.
20. Porte Cochère.

UPPER FLOOR.

1. Ward.
2. Surgery.
3. Chapel.
4. Patients' lift.
5. Operating-room.
6. Nurse.

THE EUROPEAN GENERAL HOSPITAL, BOMBAY.—Mr. T. Roger Smith, Architect.

AMBERLEY CHURCH AND CASTLE. SUSSEX.

THE restoration of the Church of Amberley is proceeding, and has given the opportunity to discover some points of interest in its history. We have received some particulars respecting both the church and the castle, but space will not allow us to do more than to call attention to this very interesting group of building, and to say that it has not yet received so much attention at the hands of competent archæologists and antiquaries as it deserves. Its remote situation in an uninviting marshy district, on the north side of the South Downs, partly accounts for this neglect; but the excuse of remoteness has been removed by the opening of the Mid-Sussex Railway. The manor of Amberley has from the Saxon era belonged to the bishops of Chichester. The existing castle was erected by one of them in the fourteenth century. A matter of peculiar interest which one of its old rooms still possesses, is an imperfect series of paintings executed in the reign of Henry VIII. The meaning of the series has never been discovered: they appear to be female figures nearly life-size. We are glad to say that the neglect of the subject is not likely to continue, as we hear of its being undertaken by more than one of the Archæological Associations.

The work of restoration of the church has been entrusted to Mr. Gordon M. Hills, of London, architect.

QUEEN'S TOWN, SOUTH-EAST AFRICA.

WE have received a photograph of a new building just erected for the Queen's Town Agricultural Bank. Only a few years ago the use of an architect was scarcely known there. Now, however, it is different. Various buildings are in the course of erection,—a new chancel to the old church, a notary's office, a merchant's store, a hotel, a new Independent chapel, a Wesleyan school-room, a gaol, and so on. Materials of construction are bad and frightfully expensive. The bank was built of brick, and plastered, with cashier's residence embodied in the plan. The cost, with fittings included, was 1,800*l*. The architect was Mr. Joseph Flashman, formerly a pupil of Messrs. Poulton & Woodman. The builders were Messrs. Read, Key, & Tiffin.

Queen's Town, it will be remembered, is situate on the extreme frontier of the eastern province of the Cape Colony. It is in the midst of a purely agricultural and sheep-farming district, and is a go-ahead English place, only ten years old.

THE NEW FEVER HOSPITAL, LIVERPOOL.

THE new hospital erected in the Brownlow-hill Workhouse is now open for the reception of patients. It is built in the shape of a letter T, by which means cross-ventilation, which is one of the primary requisites in buildings of its nature, will be secured. It is built of red and ornamented with fancy brick. It consists of four stories, in each of which are two wards. They are all constructed on the same principle. Each ward will contain twenty beds, so that the building, when fully occupied, will accommodate 160 patients. There are at present 206 fever patients in the workhouse, large numbers of whom are scattered about in different dormitories. Each ward, which is 64 ft. long by 24 ft. wide, will have fourteen windows, seven on either side. Every window has two swivel sashes, one lower than the other: the top one, being close up to the ceiling, will have the effect of preventing any foul air lodging in the wards. In addition to that, ventilators have been constructed on each side of the beds, about a foot below the patient; so that by this means all the impure air will be sent upwards. There are also eight ventilators provided in each ward, on a level with the ceiling, and communicating with the chimney-stack. There is a staircase at each end of the wards, so that in case of fire the patients could be easily and rapidly removed. Fire-places have been constructed at each end,—one with an open flue and hot plate, for the purpose of keeping fluids warm, and the other an ordinary grate. A speaking-tube and double sets of bells, communicating from each ward to the matron's apartments, have been provided. The quantity of air for each patient, when the wards are filled, will be 1,100 cubic feet; but as it is not likely that all the beds will be occupied at one time, it will probably be 1,500 ft. There are six gas-lights in each ward. Attached to the different wards is a nurse's closet, in which is a kitchen range, and a sink with a number of hot and cold water pipes. It might here be stated that none of the nurses are by any means allowed to sleep either here or in the wards, but have to retire to a distinct part of the building. The nurses are changed alternately both night and day. At the other end of the wards is a self-acting water-closet, a hot and cold water bath, a sink and lavatory, which is bountifully supplied with hot and cold water. For men and women separate airing wards have been provided.

The matron's apartment is situate at the east end of the building, at a convenient distance from, and not in direct communication with, the wards, so that the risk of her taking the disease is greatly diminished. Underneath her apartment are the reception-room and the necessary medical offices.

The washing and drying rooms are detached from the buildings, and in these departments the latest improvements have been introduced.

The hospital will cost about 6,000*l*., which sum will have to be provided out of the rates. The architect was Mr. James Wylie, the parish surveyor, and the builder Mr. Edward Hughes.

THE BUILDERS' BENEVOLENT INSTITUTION.

THE seventeenth anniversary festival of the above charitable institution was celebrated at the London Tavern, Bishopsgate-street, on Thursday, the 27th ult.; Mr. Thomas C. Lucas, President of the Institution for the current year, occupying the chair.

There was a greater number of gentlemen present on this than on any previous occasion, covers being laid for 230 friends of the charity.

Among those present we observed Messrs. William Lee, M.P., C. Lucas, Banks, J. Murray, J. Plucknett, W. M. Dunnage, T. Robinson, Tilson Lee, George Smith, G. Spencer Smith, D. Myers, W. Hubbock, J. Sheffield, W. Webb, Steddall, Randell & Saunders, C. Francis, Shepherd, Thorn Brothers, T. Ferguson, J. Dent, W. Dent, W. Downs, J. Taylor, G. Dines, J. M. Stroud, W. Hutcheons, T. Cozens, Dove Brothers, G. Head, R. Head, T. Stirling, W. C. Anderson, C. Hack, Tudor & Co., W. F. Fenton, W. Nicholson, D. Nicholson, M. Hall, S. L. Mann, J. Thorn, &c. &c.

At the termination of the dinner, the usual loyal toasts were proposed and responded to.

"The Army and Navy and the Volunteers" next followed, to which Mr. George Plucknett replied on behalf of the Volunteers.

The Chairman, in giving the toast of the evening, "Prosperity to the Builders' Benevolent Institution," said that they had assembled there for the purpose of furthering the projects of the Institution, and stated the objects and origin of the Society. It had been founded by their friend Mr. Thomas Cozens, and he (the Chairman) was happy to see that gentleman's views had been so well carried out. At the present time they had thirty-six pensioners on their funds, — seventeen males and nineteen females; and since the formation of the Society forty-four pensioners had died. He then referred to the gratifying rise of the Institution since its establishment in 1847, and the pleasing fact that they had now invested in the Three per Cent. Consols the sum of 9,862*l*. He would, however, say that that sum could be made much more, for at the present time there were in London upwards of 16,000 people connected with the building trade, and it therefore might be a matter of surprise that such a sum was not far greater; but he thought some system might be devised by which one-third of that number might become contributors of their half-guinea or guinea a year. He hoped that at the expiration of his year of office he should leave the funds of the Institution in a better condition than he found them. He (the Chairman) then alluded to the necessity of supporting such a society, for many tradesmen who were then prosperous in business might, by misfortune, be reduced and come to nothing. Such cases were not fancy, but a reality. There was another point to which he referred, namely, that owing to a want of funds they were unable to elect all their candidates, and as many as fourth applications were made. The allowance to male pensioners was 24*l*. a year, and to the females 20*l*. Now, what he wished was the funds so increased that a greater number of pensioners might be elected; and further, that the recipients might live with their friends, and not be estranged from them by living in almshouses. He then showed that, as candidates were not eligible for election until they were 65 years of age, efforts should be made to relieve their unfortunate brethren as quickly as possible, so that the latter part of their lives might be rendered comfortable. In conclusion, he called attention to the fact of there being another election in November, and he hoped that his words would convey to them his wish on behalf of the Institution, and that his appeal to them would not be in vain.

The toasts of "The Chairman and President," "The Patrons of the Institution," and "The Vice-President and Trustees" next followed, and were duly responded to. With the last toast, however, was accompanied the name of Mr. Thomas Cozens, the founder of the Institution, on whom the Chairman passed a high eulogium, concluding by wishing him "Long life and happiness."

Mr. Cozens returned thanks, and hoped that the Institution would eventually become one of the first in the world. He was one of those who thought that "we should not live for ourselves."

The next toast, proposed by the Chairman, was "The Treasurer," to whom, he said, they were deeply indebted for his warm advocacy of the Institution, and his taking care of the money.

Mr. Plucknett replied by stating, that they were deeply indebted to their worthy chairman, who had taken so great an interest in the Institution; and further, in obtaining so large a number of friends as were present on that occasion.

The "Architects and Surveyors" was next given, and was responded to by Mr. Banks, of the firm of Messrs. Banks & Barry.

The Chairman then proposed the toast of "The Brighton Branch of the Institution, together with its Chairman, Directors, and Honorary Secretary," which was also honoured.

Mr. Harris, the secretary, then read over the list of donations and subscriptions for the evening, amounting to 760*l*. The following is a list of the principal donations:—

Thomas Lucas, 105*l*.; Lucas, Brothers, 52*l*. 10*s*.; Sir S. Morton Peto, bart., M.P., 21*l*.; Cheswright, Sheffield, & Co., 21*l*.; John Kelk, 21*l*.; Messrs. Hubbock & Son, 100*l*.; J. B. White & Brothers, 10*l*. 10*s*.; Geo. Jennings, 10*l*. 10*s*.; Randall & Saunders, 10*l*. 10*s*.; Wm. Cubitt & Co., 10*l*. 10*s*.; Geo. Plucknett (annual), 5*l*. 5*s*.; W. Webb, 21*l*.; Thos. Ferguson, 10*l*. 10*s*.; Jas. Murray, 5*l*. 5*s*.; J. & W. Eastwood, 5*l*. 5*s*.; Stevens & Son, 5*l*. 5*s*.; Lawrence, Brothers, 5*l*. 5*s*.; Beard & Dent, 5*l*. 5*s*.; Lee, Son, & Smith, 10*l*. 10*s*.; Tilson Lee, 5*l*. 5*s*.; Thos. Lambert, 5*l*. 5*s*.; Kebbel, Shepherd, & Co., 5*l*. 5*s*.; Pfeil & Stedall, 5*l*. 5*s*.; G. Spencer Smith, 5*l*. 5*s*.; George Smith, 5*l*. 5*s*.; Joseph Taylor, 5*l*. 5*s*.; G. Myers & Sons, 5*l*. 5*s*.; R. J. Rankin, 5*l*. 5*s*.; Francis, Brothers, & Pott, 5*l*. 5*s*.; Messrs. W. J. Freeman, 10*l*. 10*s*.; H. C. Bunkell, 5*l*. 5*s*.; Dove, Brothers, 5*l*. 5*s*.; Smith & Son, 6*l*. 6*s*.; S. & W. Tudor, 5*l*. 5*s*.; ditto (annual), 2*l*. 2*s*.; R. W. Kennard, M.P.; 5*l*. 5*s*.; J. G. Lawford, 5*l*. 5*s*.; Wm. Downs, 5*l*. 5*s*.; Thos. Stirling, 5*l*. 5*s*.; J. W. Battley, 5*l*. 5*s*.; Chas. Hack, 5*l*. 5*s*.; W. C. Anderson, 5*l*. 5*s*.; Henry Barrett, 5*l*. 5*s*.; J. May Stroud, 5*l*. 5*s*.; Thorn & Co, (annual), 10*l*. 10*s*.; Wm. Peters (annual), 5*l*. 5*s*.; E. Bennett & Son, 5*l*. 5*s*.; &c. &c.

VISIT OF THE METROPOLITAN BOARD OF WORKS TO CARLISLE.

ON Saturday morning the Metropolitan Board of Works, including the chairman, and about twenty-five members of the Board, accompanied by their chief engineer, visited Carlisle, to inspect the works in operation there for the utilization of the sewage of that city. They proceeded to the Willow Holme, near the main outlet of the sewage of the city, where the works, conducted by Mr. Alexander M'Dougall, chemist, are in operation, and that gentleman explained to the Board the manner in which the sewage is applied to the land he has in hand. The area actually irrigated is about 60 acres. A broad canal is run round the field, which can be stopped up at any point, and sewage diverted into moveable iron channels, from which it is shed upon the land. Mr. M'Dougall stated that the principal part of the sewage of Carlisle is thus utilized. Speaking in rough numbers, the population in the district of which the sewage is not utilized, but is run into the river, is about 7,000 or 8,000; while that of the whole of the other districts of the town (all the sewage of which is applied to the soil) is 22,000 or 23,000 people. Mr. M'Dougall stated there had not been any complaints made of the slightest smell from his land or works, and the Metropolitan Board verified this by their own personal inspection and observation. Mr. M'Dougall further said that he considered the produce on the irrigated meadows

to be about four times as great as that on the land to which the liquid sewage is not applied; and in some parts, where the irrigations had been made more frequently, five times as great.

METROPOLITAN BOARD OF WORKS.

At the last weekly meeting of the Board, the following subjects were considered.

Middle-row, Holborn.

The Board passed a resolution to the effect, that the destruction of Middle-row, Holborn was imperatively called for, and the matter was referred to the Streets Committee for the purpose of taking the necessary measures to carry it into effect.

Expenditure on Thames Embankment.

Mr. Bazalgette made the following report. The total cost of work executed to the present time on contract No. 1 amounted to about 67,000*l.*, of which the sum of 36,180*l.* was for plant, and 30,820*l.* for work done. On contract No. 2, the cost of work done to the present time was about 47,000*l.*, of which the sum of 12,000*l.* was for plant and 35,000*l.* for work. The advances by the Board on Contract No. 1 amount to 60,000*l.*, and on No. 2, to 35,502*l.*

Some members objected to the advance of so large an amount as 90 per cent. when so great a portion of the expenditure was for plant; and at the close of the discussion the matter was referred to the Thames Embankment Committee.

Proposed Improvement Rate.

It was referred to the Streets Committee to consider the desirability of applying to Parliament to obtain authority for the Board to levy an improvement rate on the metropolis, with power to confer with the Government thereon.

Materials for Thames Embankment.

Mr. Bazalgette read a report, signed John Hawkshaw and Thomas E. Harrison, dated 26th ult., in which the reporters say:—

"A considerable portion of the stuff dredged from the river is soft mud, and we are of opinion that this mud is not a proper material to be used in forming the embankment, nor is the embankment formed by the material dredged from the river so solid as that formed by materials obtained from the land and carted on to the embankment. We are further of opinion that a mixture of the materials dredged from the river with the materials obtained from the land will form a better embankment than if the materials dredged from the river alone be used. In the construction of that portion of the embankment forming the immediate backing to the river-wall, we think that materials obtained from the land and deposited by carts parallel to the line of the wall, and thus consolidated as the work advances, will make a better backing to the wall than the material dredged from the river."

The report was referred to the Thames Embankment committee.

LONDON STREET-ARCHITECTURE.

Sir,—Much as I delight to witness improvements in street-architecture in the City, I always turn with pleasure into Austin Friars, to feast my eyes and mind upon the remnants of the fine old church which names the place. It is, as is well known, undergoing restoration; the tracery of the magnificent decorated windows has been renewed; and a fine timber roof crowns the whole. But, as yet, I see no signs of that which is most necessary to impart a thorough and unmingled expression of beauty to the church. The whole of the exterior is stuccoed, and in the centre of the west front, under the great window, is a door, professedly in the Pointed style, yet so mean, so pitiful, so imbecile, as almost to make one believe that the designer, whoever he was, designed it out of spite to the beautiful church he designed it for. Yet this doorway remains, and the stucco remains. The windows are magnificent, though their glass is but tinted; the interior is lofty and spacious; the piers and arches are graceful, but their image is effaced by that of the miserable west doorway. Why not sweep it away? Funds might not allow of the scraping of the building, but the expense of destroying this doorway, and substituting one in harmony with the window above, would not be great, while the good done would be without measure; in fact, as I have said, the rest of the building depends upon it.

While I am speaking of Austin Friars, I might say a word with regard to the new building at the entrance in Broad-street. From Austin Friars it is nothing, being an ordinary plain expanse of stucco. But, passing under the archway, and crossing Broad-street, the view of the building then obtained is rather striking. By the way, this archway is vaulted on the principle of brick tunnels resting on iron girders. These remained in their truthfulness for some time, and looked very well. But I thought it could not last, and the other day I found this vaulting covered with the demon of good architecture. I do not think it is intended to resemble stone; but it was only applied from a repugnance to brick that I cannot understand. Before, the construction was displayed in all its power (I believe the plan is comparatively new, I only know one other instance, externally, in the City), but now it might be anything; it might be mere rotten boards put into the arch form.

This building you mentioned some time ago as being an attempt at the union of the styles. At last it is attempted. The mountain that has been growing for years has at last brought forth its mouse; for a mouse it is, as far as regards the union. I cannot describe the building from the difficulty of standing before it; but I recommend all those who have speculated on the union, to go and see the first attempt, and how utterly it has failed. I do not mean to say that because this building is a failure, the styles cannot be united (though I do say so for weightier reasons); but after so much talk about it, were it practicable, we might have by this time seen it accomplished. But it seems not, and I hope it will never be tried again.

The general effect of the building is good. It is of stone, with a high roof, and stone dormers, with an open parapet between them. This roof and its accompaniments are the best part of the design. The classic ground-floor is ponderous; the cusped windows above are stiff, without life or feeling; but the roof is of good pitch, and is an ornamental feature, which I wish was better appreciated. Though horizontal, its recession produces an angle which connects the horizontal lines beneath it.

In Broad-street, nearer the Exchange, is a small Gothic building, with some good points, of which the tasteful use of brick is the most so; and, talking of Gothic buildings, the example in Cheapside is ruined by the roof being invisible.

In Friday-street is a small Gothic warehouse, with three lofty lancets on the ground-floor, which look very well, and do their duty very well; and, lastly, I hear, to my great regret, that the magnificent pile in Bishopsgate-street, only built a few years ago, I mean Crosby House, is to be pulled down, after a shortlived glory: the reasons for the destruction I do not know.

Ex Stirpe.

ARTISAN ART-EDUCATION.

Will you allow me to add a word or two more to what has been already said on the proposed Art-Result Society? I have tried to bring my views into as narrow a compass as I can, in a prospectus issued. I think there can be no doubt that the idea of bringing into notice and practical recognition the class of men now working out all our *designs* in common things is a good one, and ought to be done fairly, and from those I know would be kindly and gratefully received. My first proposition is that they do *everything* of this kind except *painting*. The *workmen* may be fairly said to be now no longer in fear of forgetfulness, and it will be their own apathy only which can cause them again to fall into neglect.

That the workmen need yet much help and guidance, is clear enough from the Islington show, it being a very unfortunate thing that they all should have got hold of the idea that they are more capable of showing cleverness *out* of each man's trade than in it. All those I had anything to do with in Canon-row, seemed to think this, and that their own special trade skill needed no help or improvement. Nothing but continual urging and reminding will take this notion out of their heads, vital as it is.

I have only been able to hint at the specialities of painting, sculpture, and architecture; but any one who will give the subject a little thought, will soon see what a change will take place if the individual art *hand* work of each artist but once comes to be recognised and *asked* for. The dignity of the Royal Academy must be made to spread itself, and to include the power of indicating the art of common things as in past times. The idea of an Art-Result Association does not exist except in this Royal Academy.

Not to trouble you with more detail, I will but add that I think these three principles will be found to comprehend the general idea which I think we ought to have in view, and which I hope you will agree with.

Premising,—that all the *old art* of any value at all is simply the result of the *hand* and mind labour of each individual artist workman,—there being then really no artists, in our sense of the word;—and further that this old time-honoured way of work is now utterly abandoned by us moderns, except in painting. We have, therefore, to strive, as I think, first, for—

A *practical* beginning for the change towards the *old* method of art work by the hand of the individual artist, and thus to lecture practically, and try to work out in material the recommendations of our lecturers and art teachers.

To enforce the principle that each artist mind is individually valuable and productive, but lost if converted into a mere tool or machine; and that for one artist to work over the art-product of another is simply to expunge it, and thus lose the art-strength of both.

An absolute return to *natural forms* and *life*, whether conventional or otherwise, in all ornamental details, in whatever style of art the artist may be compelled to practise.

I cannot but think that a society founded on these leading principles would do infinite good as a new mode of art-action.

C. Bruce Allen.

CRUMBS FROM THE CLOSET.

1. Nero is said to have been so extravagant as to have shod his horse with silver shoes, and his empress's horse with golden ones. No doubt that is mere chaff. Had they any shoes at all? No equestrian statue,—no bas-relief of horses, Greek or Roman, contains, as far as I know, any trace of shoes. Beckmann says that horses were first shod in England by the Normans. How did Boadicea manage? In the present day, if a horse goes ever so short a journey without a shoe, he is in great peril of getting lame or spoiling his hoof. Beckmann thinks that the Roman horses, as well as the mules and asses, had a sort of sock or sandal drawn on over their hoofs. If they had, the Roman sculptors were so disgusted with their clumsy appearance that they ignored them.

2. The Savoyards were formerly, if they are not still, the chimney-sweepers of Paris. Beckmann says, that in Germany they all came from the Hartz. In England do we grow our own? and why are those poor smutty children such distinguished mummers on May-day?

3. Walpole says that Saxton, Henry VIII.'s fool, was the first to wear a wig in England. Will our lawyers be the last to leave them off?

S. S.

GLAZING.

The plan I find it best to adopt in fixing glass into stone mullions is this:—I first run a coat of double size into the groove, then use common linseed oil putty, with a very little salad oil beaten up with it. The size prevents the oil running into the stone, and showing a stain on the outside: the salad oil prevents the putty ever becoming very hard, though quite firm enough for the purpose of security. The glass, having thus a somewhat yielding bed, will never break by the usual cause.

H. Havell.

ARCHITECTS' PUPILS.

If your correspondent "A. P." will look through past volumes of the *Builder*, he will see that his lament is but a re-echo of letters written long, long since. Year by year the same sad and humiliating plaint appears.

Many architects consider that all they undertake to give their pupils is the "run of the office." This term in practice means that the pupil shall regularly attend and work for his master during office hours, run errands, trace, print, draw, and write according to circumstances. These operations will not make him an architect; yet the master pays but little attention to him, and pockets the premium.

Just contrast the case of a pupil and a junior assistant entering an office at the same time. The first paying a premium of 300 guineas, the latter receiving for his first year 5*s.* per week; 20*l.* for his second year, 25*l.* for the third, 30*l.* for the remaining two years. The pupil (calculating interest at 4 per cent.) will put 468*l.* 6*s.* into the master's pocket; the other, with a like allowance for interest, will have abstracted 121*l.* 6*s.*; the gain, therefore, to the master, by substituting a pupil for a junior, is 607*l.* 12*s.*, an amount which surely entitles the pupil to some consideration.

There are few parents who, wishing their sons to enter a profession, think from 80*l.* to 100*l.* per annum too much to pay for *education*. Nor is it so; but they should be careful to place their sons with a professional man who gives attention to his pupils' education, and they should mistrust those who tell them that "their sons will have all the advantage of the run of the office, will see all the work that passes through it," &c. This is not enough: much

more is needed; and much higher education must be given ere the pupils of our profession can enter into business life in a creditable manner.

There are many energetic men who really work for and with their pupils, though I fear that so much cannot be said for all the members of the profession who accept the responsibility and premium.

It is really a sacred duty, the very life and soul of progress in our art; and it rests with parents to seek out those men who view the education of pupils in the light I now exhibit it. A. F.

*** A pile of letters on the same subject *pro* and *con.* has been received.

FIRE-PROOF FLOORS.

SIR,—The comparative statement of the cost of fire-proof flooring, as given in your issue of Oct. 15, is quite correct, as all are calculated on the same prices; Messrs. Dennet not having made a deduction for tiles and levelling-up for same on the brick arch. The thickness for Fox & Barrett's system varies according to the span; and for 14 ft., the thickness given is what I have had executed under my directions. HENRY M. EYTON.

CIVIL ENGINEERS IN INDIA.

SIR,—Will you allow me—with reference to a letter in the *Builder* of Oct. 22nd, which dissents from the views put forward by me in your number of June 11th—to repeat that I spoke only for the engineers who went out in 1855, to Bengal and Bombay. Your last correspondent, on the contrary, speaks for "Lord Stanley's engineers," the first of whom went out in 1859, and with whose case I am not so familiar; but it appears to be very ably stated in the leading articles of the *Calcutta Engineers' Journal* for June 1st and August 1st, from which it would seem that the case of those engineers, as regards promotion and position, is not quite as put by the different correspondents, but rather that their grievances are,—the alteration of leave and pension rules, the smallness of their pay under enhanced cost of living, and the slowness of promotion in the department generally.

I would suggest that they address a memorial to the Indian Government, setting forth the fair claims of the service, which I am persuaded, with your powerful advocacy and that of the *Calcutta Engineers' Journal*, would have good prospects of success. But they should not weaken their case by groundless or trifling complaints, by charges of unfairness, and attempts to depreciate the military engineers, who stand in need of no defender, whatever may be the defects of the public works' system.

A BOMBAY CIVIL ENGINEER.

COMPENSATION CASES.

Cannon Street, London.—At the Lord Mayor's Court on Saturday, before Mr. Karslake, Q.C., as assessor, and a special jury, a compensation case, "Lawrence and Others *v.* The Charing-cross Railway Company," was heard. Mr. Bovill, Q.C., and Mr. Horace Lloyd, were counsel for the Lord Mayor; and Mr. Lloyd, with whom was Mr. Shiel, represented the Company. The claim in this case was in respect of two houses, Nos. 5 and 6, Common-street, New Turnwheel-lane, which were built in 1852 by Mr. Alderman Lawrence, and let respectively at 350*l.* and 450*l.* One was leased to Baron Rothschild and would expire in 1866, and the other to a public company and would expire in 1874. The principal question raised before the jury was the value of the reversion. All the witnesses admitted that property in the City of London had greatly increased in value within the last few years. It had "enormously" risen in price within the "commercial area," and a question was mooted whether the houses were within that area. Several witnesses described the houses as worth respectively 650*l.* and 850*l.* a year. One was at the corner of Turnwheel-lane. On the part of Mr. Alderman Lawrence the property was valued at upwards of 30,000*l.*, the highest sum being nearly 30,700*l.* On the other hand, for the Company the valuers estimated the worth of the two houses from 21,000*l.* to 21,600*l.*, including the usual ten per cent. for a compulsory sale. Mr. Ryde, the surveyor of the Charing-cross Railway, considered that 21,641*l.* was a liberal price for the property in question, and he offered a sum of 23,000*l.* Mr. Lloyd entreated the jury not to be led away to give an extravagant sum. He thought that at the present time, when money was fetching eight and nine per cent., a gentleman would be glad to receive his money. Mr. Bovill ridiculed the view taken by Mr. Lloyd, as to the culminating point in the value of property and the means of investment at the present time. The value given had been attained in the last ten years, and was increasing. It showed the great wealth of England, and the large sums made by commerce. The question was not what was to be obtained for money at a month or so, which might be eight or nine per cent., but what it would yield as a permanent investment in ivly Funds, which would be from 3 to 3½ per cent. The learned assessor, in placing the case before the jury, contrasted the evidence given on both sides, and told them that the question was, what was a fair and liberal compensation for the property. There was nothing in the Act as to ten per cent. being given for a "compulsory sale." It had been the practice for juries to do so, and it was for them to give the amount, or any other sum. The jury retired, and on their return assessed the value at 25,100*l.*, including 100*l.* for fixtures.

Milton's House, Barbican.—On the 20th ult., at the Lord Mayor's Court, before Mr. Commissioner Kerr and a special jury, a compensation case was tried, "Hayward *v.* The Metropolitan Railway Company," to award a sum for the house No. 17, Barbican, in which Milton had for some time resided. Mr. Hawkins, Q.C., and Mr. Potter, were for the claimant; Mr. Lloyd and Mr. Hollway for the company. On the part of the claimant (a lady) nearly 3,700*l.* were claimed, and on the part of the company 1,500*l.* had been offered. In 1860, a person who resided in Essex, and who, it was stated, could not have known "what he was about," leased the premises at 65*l.* for 21 years, and on the same day the lessee sub-let the premises at 125*l.* That lease had 17½ years to run; and the principal question in the case was the value of the reversion. As an instance of the value of the property in the city of London, it was proved in evidence that as much as 2,000,000*l.* per acre had been given. Mr. Commissioner Kerr told the jury that witnesses became insensibly biassed in favour of the parties for whom they appeared, and that was the only way to account for the great difference in the opinion of the values. The jury eventually awarded 3,250*l.*

WATER SUPPLY.

Bath.—A report has been presented to the town council by the city engineer, Mr. Alfred Mitchell, on the subject of an additional supply of water to Bath. The engineer recommends the use of the numerous springs in the St. Catherine Valley, and he has prepared plans of works, including a high-level reservoir at the head of the valley, 14 acres in extent and 45 ft. in average depth, and capable of containing 90,000,000 gallons, at an elevation of 289 ft. above the Abbey pavement;—as also a low-level reservoir in the Oakford valley, to contain 20,000,000 gallons, at an elevation of 150 ft. above the Abbey pavement level. The cost of the proposed supply he thus estimates:—

Reservoir at Cold Ashton	£15,798
,, ,, Oakford	6,825
Purchasing lands and collecting springs	6,752
18-in. main laying complete	19,937
Engines, pumps, house, and reservoir for Lansdown service	3,200
9-in. main from Lansdown to Combe-down	4,820
Purchase of five mills and rights of water	5,200
Law expenses	1,860
Engineering expenses	1,676
Total	£66,058

Halifax.—The tenders for the construction of three new reservoirs in Luddenden valley, in connexion with the Halifax corporation water-works, have been opened. The number was eleven. They are still under consideration, but we understand that they are all above the engineer's estimates.

Huddersfield.—A short distance above Marsden, near Huddersfield, is a reservoir known as the March Haigh Reservoir, which belongs to the London and North-Western Railway Company, and is used for supplying a canal, by a tunnel more than three miles long. A few months ago, complaints were made as to the state of the embankment, and some repairs were done; but of late more complaints have been made, and the local Board of the township have taken up the matter. They consider that it is highly censurable to keep it full of water in its present condition. The reservoir is only one of several situate on the Standedge range of hills above Marsden.

Cockermouth.—The local Board determined the site for the proposed waterworks, from the several schemes recommended by Mr. Lawson, C.E. After a long discussion on the merits of the various schemes, it was unanimously resolved "That No. 3 scheme in Mr. Lawson's report of the 21st of October, 1864, for taking the water from the Cocker below Rubby Banks Mill, be adopted, and that the engineering committee be empowered to treat with Major Thompson, and carry out the scheme."

FROM SCOTLAND.

Edinburgh.—At a recent meeting of the town council, a letter was read, from Mr. George Kinloch, intimating the intention of a citizen of Edinburgh to present 2,000*l.* towards the expense of erecting a grand ornamental fountain in the West Princes-street Gardens, similar to the one in the Kensington Horticultural Gardens, and exhibited in the International Exhibition of 1862. He suggested that it might be placed at the foot of South Frederick-street, or South Castle-street, which would still leave one of these places open for the Prince Consort Memorial, should a site be chosen in that locality. The price of the fountain was estimated at 4,000*l.*, but it might perhaps be got cheaper; and the donor proposed that a subscription should be made by the public for the remainder of the price and for the expense of erecting an ornamental screen like that behind Sir Walter Scott's monument. He also proposed that the sum of 900*l.*, which the town council had in trust for the erection of statues for Bruce and Wallace, should be expended in connexion with this matter. The letter was remitted to the lord provost's committee.

Aberdeen.—The movement in favour of a public park for Aberdeen has been stimulated by the steps in the same direction now being taken in the metropolis and elsewhere throughout the country. A committee of working men has had several meetings, with a view of bringing the prevailing feeling into practical shape, and a preliminary meeting of employers of labour and other influential citizens is to be convened, to consider the best means of raising funds, and of putting the matter in form, to be brought before a public meeting of the inhabitants.

Kirkwall (Orkney).—The harbour trustees of Kirkwall are at length about to erect an iron pier, which is to run out from nearly the quay-head of their old harbour. The structure is expected to cost from 11,000*l.* to 12,000*l.* There is much complaint for want of harbour accommodation. By the time the new harbour will be completed, another great improvement is intended to be carried out—a matter of the first importance in a town whose principal street, as *John o'Groat's Journal* remarks, makes two "wheelbarrows tremble when they meet." It is purposed to form a new street leading from the lower end of Broad-street, through the vacant space there and the old Castle of Kirkwall, down to the harbour, by removing a block of stores opposite the Aberdeen, Leith, and Clyde Company's office, and by erecting there a landing-quay for the discharge of cargoes and for small craft.

IRELAND.

Dublin.—A house in Grafton-street has fallen. About a week before a house on the south side was taken down for the purpose of rebuilding it, and when the support which this dwelling gave was withdrawn, the house began to show signs that its condition was not at all secure. This, it is stated, together with the high wind which prevailed, accelerated the demolition of the building. A considerable portion of the front fell into the street.

Clonea.—The new Roman Catholic Church of Clonea has been dedicated. It stands in a wild picturesque district of the County Waterford. It was designed by Mr. J. J. M'Carty.

THE COMING WINTER.

AFTER one of the finest summers for fair weather that have been known to most people, the grey clouds, the mists, and the colds of winter, are rapidly closing in; and with this ungenial season there come trials to the poor. They who have seen with their own eyes the privations which exist amongst thousands of families in various parts of the metropolis, even in the bright warm summer time, look with anxiety to the pressure of winter, when work is scarce and household expenses are heavier than at other seasons.

Often, after a bright summer, we have a hard winter; but even if this year should prove an exception to the general rule, there is plenty to be done to bridge over the distress which unfortunately exists not only in the metropolis, but in other towns. The hardships which have been so patiently borne by the cotton-spinners of Lancashire have not yet passed away; and in some localities there is much to excite grave considerations as to the coming cold season. Although in the main the cotton trade is improving, still there are ebbs and flows of the cotton market which cause distress and starvation to thousands. Take, for instance, the accounts we have from Preston, where the office of the relief committee is. It is reported that 2,156 cases, comprising 8,162 persons, were relieved during a week just past. There was an increase of applicants during seven days of 1,001 persons. When the distress was at the greatest in this town, there were 3,347 persons relieved by the fund which was raised by the national subscription. Notwithstanding the figures given by the committee of the management of the relief fund, we find the following state of things:—

"The committee have just taken the census of the factory population, by a house-to-house visitation, when it was discovered that no less than 6,874 factory operatives had either emigrated, found employment elsewhere, or had been removed by the guardians. The chief constable's weekly report shows that in his district there are twenty-three mills closed out of eighty-seven. The number of operatives working full time is 38,253. Five days a week 2,787; four days, 406; three days, 4,503; two days, 67; *and totally unemployed*, 16,985."

Seven deaths from fever have just taken place in Preston in one week, and an inquiry into the state of the infected districts has been ordered. We hope that this sanitary inquiry will be wisely and carefully managed. One point is most necessary to be known, viz., how the pressure of the distress has acted in driving families into limited space.

It is impossible to remove by even the most extensive charity the evil which still hangs over Lancashire; but there, as well as in the parts of London which we have felt it a duty to describe, soup-kitchens and other similar helps might be again established, which would be exceedingly useful in their way; and now is the time to assist in re-opening them.

CHURCH-BUILDING NEWS.

Wherstead (*Suffolk*).—The church here has been re-opened. The porch is of open framework, in oak, the interstices of which are filled with coloured glass. The entrance from the porch into the church is by an old Norman doorway. The stained glass in the west, east, and south chancel windows first draw the attention on entering. The first of these was designed for a memorial of Sir Robert and Lady Harland; the second to Captain George Ashley Dashwood; and the third is a memorial of two of his children. The first of the three has for its subject the acts of charity, Feeding the Hungry, Clothing the Naked, and Visiting the Sick and the Prisoner (Matthew xxv. 35). The window is by Mr. Holland, and till brought here was to be seen at the South Kensington Museum. The east and south chancel windows are by Mr. Gibbs. All the remaining windows also are of stained glass, but without subjects, being in the pattern style, and giving to the west, east, and south chancel windows the desired prominency. There is not a pane of uncoloured glass in the church. The roof is throughout of open oak-work. The old chancel roof, when stripped of the accumulated whitewash of many generations, was found in good repair, and was therefore retained. The style of the new roof of the nave is taken from that of the old roof of the chancel. There is nothing elaborate about it. The walls, which are about 4 ft. in thickness, have been coated externally with dressed flintwork, and the inside has been faced with white Parian cement. The whole church is paved with Minton's encaustic tiles; the main aisle with his red and black diamonds, and the open space within the chancel with a pattern of red and black, lighted up here and there with yellow. Within the communion-rails, which are of brass, the floor is paved with Minton's richest design, the golden *fleur-de-lis* and rose, placed on a blue ground on alternate tiles, the borders being of a rich brown and gold. The font, executed by Mr. Williams, has been covered with sculptured subjects. It consists of an octagonal basin, supported by a clustered pillar. The stone pulpit was the work of M. Abeloos, of Louvaine, carver. The main subject is the Saviour, under the figure of the Good Shepherd. The panels to the right and left of the central one contain "The Rose of Sharon and the Lily of the Valley." Each of these supports a scroll, bearing in the one case the text "Feed my lambs," in the other, "Feed my sheep." The fourth panel is filled with the emblem of wrath assuaged and reconciliation, the fruitful evergreen olive. The north wall occupies what might have been about a panel and a half; the rest, being the side towards the east, is completely open. The work has been completed by the addition of a vestry, and of a heating apparatus, neither of which the church possessed previously. For the restorations Mr. Phipson was the architect, and Messrs. Ringham & Son were the builders.

Haddenham (*Bucks*).—The parish church of Haddenham has been re-opened for Divine worship. The church is one of the most interesting of the parish churches in the county, and includes a unique and beautiful Early English tower, illustrated by Parker in the "Glossary of Architecture." The effect of the interior of the edifice had been destroyed for many years by whitewash, semi-circular plastered ceilings, and other objectionable things; but the old oak sittings, with richly-carved ends, the chancel and chancel aisle, and screens of the early part of the fifteenth century, still remain to testify to the former beauty of the church. Within the last few years an attempt has been made to raise a sum of money for the purpose of restoring the principal features of the church, and the amount subscribed was found sufficient to justify a commencement of the work at the end of last year. The chancel has been re-roofed with open timber framing, a new east window has been introduced in place of the Domestic one which existed, the interior stonework has throughout been cleared of whitewash, and the seats have been re-arranged so as to provide accommodation for an increased number of persons. Such new seats as have been added correspond in design with the old oak seats of the church. The work has been carried out by two of the parishioners, Messrs. Rose & Son, under the direction of Mr. D. Brandon. It is expected that further sums will be forthcoming to carry on the work of restoration.

Aldenham (*Herts*).—The new church which has been built at Radlet, in the parish of Aldenham, has been consecrated by the Bishop of Rochester. The site was the gift of Capt. Phillimore. Messrs. Smith & Son were the architects, and Mr. Harris the builder. The church is in the style of the fourteenth century. The material is flint and Bath stone. The building consists of nave, transepts, and chancel, with a porch at the south side. At the north-east corner is a tower, and a spire of Bath stone. The church contains sittings for 240 persons. At the east end there is a stained glass memorial window.

Tunbridge Wells.—The chief stone of a new church, to be dedicated to St. Luke, has been laid at Broadwater Down, in the parish of Frant, and equi-distant from the Frant and Eridge roads. It is to be erected at a cost of 5,000*l.* or 6,000*l.*, which will be defrayed by the Earl of Abergavenny. The church is intended to hold upwards of 600 persons, and the ground-plan will be in the form of a cross, having a nave and aisles with chancel, and vestry and organ-room adjoining. At the north-west corner will be a lofty tower and spire. The style of the church will be the very early French Flamboyant. It will be built in hollowed walls of stone, lined with brickwork, to prevent dampness. The tracing of the windows, however, and the ornamental part, will be in Bath stone. The roof will be of open timber, springing from carved corbels. Provision is to be made for the erection of a gallery in the church, in the event of its being found necessary. The architect is Mr. R. Roumieu, of London; and the builders are Messrs. Mansfield & Son, of London.

Bristol.—The vestry of St. James's Church determined in the autumn of last year to restore this ancient church. The great difficulty they found, remarks the local *Mirror*, was to enlarge the old church without throwing down the old Norman piers, which were, and still are, considerably out of upright, and composed of a thin outside coating of free-stone, inclosing an interior of rubble work, now little better than sand. It was felt by the architects that it would be an act of vandalism to pull down so ancient a structure, and upon their advice Mr. G. G. Scott's opinion was asked as to the advisability of building a new aisle upon the north side, and the placing of piers to support the ancient flying buttresses existing against the north wall. The whole of the drawings and designs were then made by Messrs. Popes & Bindon, and estimates obtained and the work commenced, which was certainly of no ordinary character, as nearly every one had prophesied the old church would tumble down. The north wall and arches were shored up with timber, and the new aisle built before the old north aisle was demolished. The granite shafts were placed on account of strength, and as being less obstructive to sight than freestone ones of the requisite size, and a style of early Gothic, instead of Norman, so as to afford the height requisite for so large a church. The old flying buttresses were found to be composed of portions of tombstones of the fifteenth century. The lower portion only of the old north wall was composed of Norman masonry, about 4 ft. high, built of Brandon-hill stone. The upper portion was entirely built of Pennant, and of much later date. The new aisle is 26 ft. wide, and extends the whole length of the church. An organ-chamber has been erected upon the north-east corner. The old west end has been washed with Ransom's mixture for preserving stone. The interior Norman shafts have been painted, as in a former restoration it was considered right to enclose them with stucco. The whole of the church has been repewed with stained deal, the aisles paved with Minton's tiles, and the church lighted with gaslights manufactured by Skidmore, of Coventry. Mr. Melsom was the contractor, and Mr. H. Williams sub-contractor. The cost has been about 4,000*l.* The carver was Mr. Margetson.

Sheldon.—A new church has been built in the small village of Sheldon, about three miles from Bakewell, in place of the old structure, which was said to have had the largest churchyard in England, inasmuch as the said church stood on the highway, and was unenclosed. The new edifice, which is situate on ground consecrated some years ago, near the village, is from a design by Mr. Rollinson, of Chesterfield: it resembles the style of the thirteenth century, and has cost under 500*l.* Although of small dimensions, it will be found large enough for the population. The church is rectangular in plan, with a circular apex at the east end, south porch, and vestry: the west end is surmounted by a gabled bell turret: the windows are Early Pointed; and the roof of coupling spars of high pitch, the whole of which, and the benches, are stained and varnished. Mr. Gyte, of Ashford, was the builder.

East Lydford (*Somerset*).—The chief stone of a memorial church has been laid here. The site is in a field, opposite the vicarage. The edifice will consist of a nave and chancel. A tower, the altitude of which will be nearly 100 ft., will be on the north side of the chancel, and there will be a south porch. The style will be Early English, the materials Keinton stone, dressed with Doulting stone, the whole of the interior to be faced with the latter. The length of the nave will be 45 ft. 6 in., width 18 ft.; of the chancel, 26 ft. 9 in. by 13 ft. It will seat about 100. The cost will be nearly 2,000*l.*, the whole of which will be borne by the rector. Mr. B. Ferrey, of London, is the architect; Mr. Davis, of Langport, the contractor for the whole of the works.

Upper Blackley (*Lancashire*). The tender for St. Andrew's Church, by Messrs. Butterworth, of 1,740*l.*, being the lowest of six sent in, has been accepted. Mr. J. Medland Taylor is the architect.

Radcliffe (*Lancashire*).—The new church of St. Thomas, at Radcliffe, has been consecrated. The building is calculated to accommodate 1,200 people, of whom 512 will have free sittings. The building is from the designs of Mr. W. Walker, of Manchester, and it has been carried out under his superintendence. The contractor for the stone and brick work was Mr. A. Pilling, of Bolton, the rest of the works being carried out by Messrs. Allen, Howarth, & Co., of Radcliffe. The heating apparatus was supplied by Messrs. Bland, of Bury; and the altar railing was executed by Mr. Dovey, of Manchester. The sum of 1,500*l.* is required to complete the tower. Up to the present time the building has cost 7,271*l.*

Pimhole (*Bury, Lancashire*). Mr. Openshaw, of Primrose-hill, Pimhole, lately expressed his intention of building a church here solely at his own cost. The edifice is to meet the requirements of the people. The site, which is the gift of the Earl of Derby, contains over 8,000 square yards, and is bounded on the northerly side by Rochdale-road, and on the westerly side by Pimhole-lane. The church will be erected on the north-westerly side, land being reserved on the east for a parsonage-house, and on the south for schools, &c. The architect is Mr. Lawrence Booth (of the firm of Messrs. Blackwell, Son, & Booth), under whose immediate superintendence the church is being built; and the contractor for the foundations, which are now being constructed, is Mr. John Hall, of Lowes. The church is rectangular on plan, having a tower and spire 120 ft. in height, a nave and side aisles, a chancel containing stalls for the choir, and the sacrarium, an organ chapel and vestry. The total length internally, from west end to east end, will be 108 ft. 6 in., and the total width 58 ft. The width of the nave, from centre to centre of the aisle columns, will be 29 ft. 9 in., and the width of the aisles 14 ft. 1½ in. The organ chapel and the corresponding chapel on the south side will be divided from the aisles by means of a screen of open woodwork with metal-work introduced therein. The nave and aisles will be fitted up with benches, as also the chapel on the south side, mentioned above, affording accommodation for about 650 persons. The church will be in the Early English style. The materials will be, for the facing of the main body of the outside walls, parpoints of the Horncliffe stone; the dressings round the windows, quoins, sills, and strings, being of the Fletcher Bank or Birtle stone. Internally, the architect purposes to use a few self-coloured materials, such as wall tiling above the wainscoting, red Mansfield stone in the shafts of the nave columns, and also in the small columns supporting the roof principals. The roof will be open timber, stained and varnished, and plastered between the spars, except in the chancel, which will have a curved and panelled ceiling. The height of the nave internally will be about 48 ft. The whole of the woodwork, with one or two exceptions where oak will be used, will be of red deal, stained and varnished. The coupled shafts in the chancel will be of Cornish serpentine, and the floor of the sacrarium, chancel, and steps leading thereto will be laid with Minton's encaustic tiles, as also the porch, space round the font, and tower.

Fakenham.—The parish church has been restored. The work has been carried out under the direction and from the designs of Messrs. Atkinson, of York, architects, who gave their

rices gratuitously, and Mr. Bennet, of Lynn, routed the woodwork. The church is a large ucture, consisting of a nave, with aisles and estory, and a chancel. It is built mainly in Late Decorated style, except the south porch the embattled tower, which are Perpendicu-

The edifice stood much in need of restora-, and it was resolved last year to re-seat it, d to put it into thorough repair. The galleries ich blocked up three sides of the church have n removed; the west window restored and ned out; the pews replaced by open seats; nave and side aisle re-roofed; all the win-ws repaired and fitted with cathedral glass; a vestry built, and an oak pulpit, reading-sk, and lectern erected in front of the chancel th. The rector has likewise restored the chan-l at his own cost, and furnished it with new stalls and altar rails. The floor has been ved with ornamental tiles, and various other provements effected. The alterations (exclu-e of those in the chancel), have been executed a cost of about 2,700*l.*

SSENTING CHURCH-BUILDING NEWS.

Maidstone.—The foundation-stone of a Con-egational church has been laid here. The ilding will be erected on the site of the old urch, by Mr. Anscomb, of Maidstone, from the signs of Messrs. Habershon & Pite, of London, l will accommodate 800 persons. The style is alian, and the front, being the only part of the terior susceptible of ornament, will be built in ath stone and white brick. School and class-oms occupy the whole of the basement. The st will be about 3,000*l.*

Blowwich.—The chief stone of a new Wesleyan apel has been laid here. The site is a piece of nd abutting upon the High-street, near to the reen. Messrs. S. & J. Loxton, of Wednesbury, e the architects; and Messrs. Butler & March, West Bromwich, the builders. The contract m is 1,400*l.* The building will be in the Early nglish style, modified to suit the nature of the aterials which will be principally used. The ternal dimensions of the building, in the clear f the walls, will be 57 ft. by 42½ ft., and about 0 ft. in height; but in addition to this an rchestra, measuring 12 ft. by 16 ft., is designed. leats will be provided for about 600 persons.

Nottingham.—The new Wesleyan chapel and chool-rooms, in Arkwright-street, have been pened. The style is Perpendicular, but the rchitect has introduced some modifications in he interior for the purpose of giving the preacher an uninterrupted view of his congrega-ion. The roof is steep, without any division nto nave and aisles, and without a clerestory. The ground plan is a parallelogram, about 64 ft. ong by 30 ft. or 40 ft. wide. A gallery runs round three sides, and on the fourth there is a recessed chamber for organ and choir. The roof s a timber, of a partly open character. Two large school-rooms are connected with the edifice, and there are also the usual vestries and other neces-sary accommodations. Mr. Ellis was the builder; and Mr. Lomas the architect. The cost will be 2,200*l.*, and the sittings will accommodate 750 persons.

Knaresbro'.—The foundation stone of the new Congregational Church at Knaresbro' has been laid. The old chapel was totally unsuited for modern use, and was more like a barn than a building set apart for Divine worship. Some months ago it was determined to build a new church upon the site of the old chapel. Plans were advertised for, and of those sent in Messrs. Pritchett & Son's, of Darlington, were deemed the best. A slender tower and spire will rise to the height of 90 ft. at the angle formed by the junction of Gracechurch-street and Windsor-lane. The front entrance is a double doorway, with a four-light window above, 18 ft. high, with geo-metrical tracery. The plan of the church itself is a nave, with small transepts, the whole being built in the Decorated style. Including the vestibule, the extreme length of the church is 59 ft.; the width of the transept, 49 ft.; and the height, 45 ft. The nave is 38 ft. wide; and the transepts, are 35 ft. high. The windows in the side elevations, one of which is set in gable, have all transoms. The transept windows are of three lights. In the interior of the church the pews will be open, low, with leaning backs. There will be a gallery at both ends, and the church at present is calculated to hold 420 per-sons. The whole expense of the erection of the edifice, including warming, ventilating, and the architect's commission, will be about 2,000*l.*

Newcastle-upon-Tyne.—The foundation-stone of a new Wesleyan Chapel has been laid by Mrs. E. M. Bainbridge, in Clarence-street, Shield-field, Newcastle. The chapel adjoins the schools which were opened some time ago, and is in the Decorated style freely treated. It will have a nave and two side aisles; metal pillars dividing the aisles from the nave and supporting the roof of the gallery. The interior of the chapel will consist of seven bays, each 10 feet wide. The staircases of the gallery will be entered from the outside, and will be surmounted with pyramidal roofs. A covered arch will connect the schools with the chapel. The orchestra is at the north end of the building, and at the other end there will be a large gallery for the children. Under-neath the orchestra will be placed the minister's vestry; and beneath the children's gallery will be the entrance-lobby. The roof will be opened and boarded to the structural timbers. The length will be in all about 85 ft.; the interior length, 80 ft.; width, 45½ ft.; and height up to the under-side of the boards in centre of roof, 42 ft. The woodwork of the interior will be stained and varnished. Messrs. Redshaw & Smith, of Gateshead, are the contractors for the work. The building will hold about 800 persons. Mr. F. R. N. Haswell, of North Shields, is the architect, and the estimated cost of the building will be about 3,000*l.* A scheme is on foot for the erection of another chapel; the two to be erected at a cost of 6,000*l.*

Sacriston (*near Newcastle-upon-Tyne*).—The foundation-stone of a Wesleyan chapel has been laid at Sacriston, a colliery village about ten miles south of Newcastle. The site, in the most prominent part of the village, together with such materials as are produced on the estate, have been presented to the undertaking by the owners; and one of them, Mr. Wm. Hunter, sheriff of Newcastle, laid the foundation-stone. The chapel will be in the Gothic style, with red brick and stone dressings, and will accommodate about 300 persons. The length internally is about 50 feet, and the breadth 27 feet. Under the west end, and aided by the natural slope of the ground, is a school-room and class-room, capable of holding 120 children. This communicates by a staircase with the entrance porch on the south side of the chapel. The seats will be open, and those at the west end rise gradually. The roof is half an octagon in outline, and will be boarded on the under side. The whole of the woodwork will be stained and varnished. The plot of ground is to be enclosed by brick walls, except at the east end next the road, which will have a metal pali-sading, with entrance gates. Mr. F. R. N. Has-well, of North Shields, is the architect, and the whole of the works have been let to Mr. J. Gib-son, of Durham.

SCHOOL-BUILDING NEWS.

Wednesbury.—The foundation stone of a new infant school at the rear of the Wesley Chapel, has been laid by Mr. Benjamin Bloomer, of Pel-sall. The new room will be 60 ft. long by 35 ft. in width, and will be supported on brick arches, and erected at a cost of 600*l.*

Wincle (*Cheshire*).—Tenders have been ac-cepted for the erection of a new school building, with master's house, at Wincle, at a cost of about 700*l.* The late Mr. Thomas Ryle Daintry, of North Rode, gave the land for the purpose, and, besides an endowment, by his will left a sum of money in aid of the contemplated new buildings. Mrs. Daintry, desirous to see her husband's intentions carried out, resolved on com-mencing the buildings at once, the parishioners being invited to contribute towards the object, Mrs. Daintry undertaking to make good all deficiency in the funds. Mr. Sugden, of Leek, is the architect employed by Mrs. Daintry.

Salford.—The foundation stone of a new Wesleyan Sunday School has been laid by Mr. W. Holland, in Regent-road, Salford. It is pro-posed, in the first instance, to erect a Sunday School capable of accommodating 600 children, with a large room over it for public worship; and it is also intended, as soon as the necessary funds can be raised, to erect a chapel in connexion with it, the land for which has been purchased, and the plans prepared. When the design is completed, the frontage of the chapel will be to Regent-road, the schools being in the rear, with entrances from Dixon-street and Taylor-street. Altogether between 5,000*l.* and 6,000*l.* will be required to carry out the intentions of the build-ing committee. At present, only about 1,000*l.* have been subscribed. The school building, when completed, will afford the necessary tem-porary accommodation for public worship. It will be a Gothic structure of brick, with stock brick facings, relieved with black Staffordshire bricks in string courses and arches. It will be two stories in height. On the ground-floor there will be an infant school, with four class-rooms, and other offices. The upper floor will form one large room, which will be used as a general Sunday School, and, for the present, also as a preaching-room. The schools are intended to accommodate 600 Sunday scholars, including 150 infants. The architect is Mr. G. Woodhouse, of Bolton; and Messrs. J. Statham & Sons, of Pendleton, are the contractors. The total cost of the school building alone, including 100*l.* for the fittings, and 500*l.* for the land, will be about 2,000*l.*

Golden Cup (*near Blackburn*).—The foundation stone of a new Church of England school, at Golden Cup, on the highway from Blackburn to Over Darwen, has been laid by Mr. R. H. Hutchinson. The school will be 90 ft. long by 30 ft. wide, and when complete will have a schoolmaster's house and class-rooms attached. The site, which contains about 1,300 square yards of land, has been given by the Rev. Joseph Hindle; and the Rev. Philip Graham, of Turn-croft, has subscribed the wall stone.

Pendleton.—The foundation-stone of a new school in connexion with the Independent chapel has been laid. The new school, which will be erected from the design of Messrs. Frazer & Son, of Manchester, will contain twenty class-rooms, with infants' elementary class and lecture rooms. The style of the building will be Geometric. The entire cost of the building, including gas and hot-water apparatus, will be about 2,000*l.*

Buersill, Rochdale.—National schools are to be erected here for Messrs. Radcliffe. The tender of Messrs. Barnes & Howe, of Manchester, 2,324*l.*, being the lowest of seven sent in, has been accepted. Mr. J. M. Taylor, of Manchester, is the architect.

Bradford-cum-Beswick (*Lancashire*).—The tender of Messrs. Thackrah & Peirce, of Stock-port, for parish schools, has been accepted, being the lowest sent in. Mr. J. M. Taylor is the architect.

Lister Hills.—The church and congregation assembling in the Independent chapel, Lister Hills, according to the *Bradford Observer*, have recently enlarged and extended their school buildings, at an estimated expense of 1,200*l.* The new schools are in the Early English style of architecture, in conformity with the rest of the block. Messrs. Lockwood & Mawson were the architects, and Messrs. James Wilson & Sons, the contractors.

Reepham (*Lincolnshire*).—A public school-room having long been much needed in the village of Sall, the Rev. Sir E. R. Jodrell, bart., of Sall Park, has now erected, almost in the centre of the village, near the church, at his own expense, amounting to nearly 600*l.*, a large build-ing, consisting of a school-room, measuring 40 ft. by 20 ft., and a residence for the teacher, in the Domestic Gothic style, with bell-turret. The exterior of the roof is covered with blue and black tiles, whilst the interior is of open wood-work, with blue interstices. The architect was Mr. William Lightly, of London; and the builders were Messrs. Nelson & Sons, of Whissonsett. It is also the intention of Sir Edward to build several model cottages near the school, similar to those built by him last year at Saxlingham, near Holt.

Jarrow (*County Durham*).—A school has been built, and formally opened, adjoining the ex-tensive chemical works of Messrs. S. Mease & Co., at their sole expense, for the benefit of their own workpeople in the first instance, and of the residents in the locality. It will accom-modate 150 children. The buildings are in the Decorated style. The school-room is 55 ft. by 26 ft., with an open boarded roof of polygonal form, 22 ft. from floor in the centre; class-room 20 ft. by 15 ft.; with entrance porch on east side, and play-ground at the south end. Mr. F. R. N. Haswell, of North Shields, is the architect.

Morpeth.—The Bolland Industrial Schools, Morpeth, have just received additions that have doubled their size, and consequently con-siderably augmented the accommodation which the improvements in the school, and increase in the number of scholars, under the auspices of the rector, the Hon. and Rev. F. R. Grey, rendered desirable. The former school serves as the basement for a large, light, airy, open-timber-roofed room, which has been built over it, and projected over an additional area by

means of arches thrown over a fore-court that extended along the front of the former house. This arrangement was adopted by the architect, Mr. F. R. Wilson, to avoid encroaching upon the playground for extra space. The elevation next the street consists of an arcaded cloister of five arches, surmounted by the new school-room, which is lighted by five lancet triplets and five rose ventilating windows in as many gables, each triplet being directly over one of the arches, and under one of the gables. The new school-room is 50 ft. long by 26 ft. The materials are white and red bricks, arranged in bands. The contractors were—H. Hudspeth, mason, and Thos. Forster, joiner, Alnwick; Thos. Cranston, plumber, and John Cranston, slater, Morpeth.

THE THEATRE.

The Haymarket.—In the part of *Mrs. Haller*, in Kotzebue's lugubrious but still effective "Stranger," Mdlle. Beatrice has made her value more evident than before. This lady is a decided gain to the English stage, and we look to see her talents made good use of.

The Olympic.—This theatre, opened under the management of Mr. Horace Wigan, has been improved before the curtain, and decorated with great taste and delicacy, by Mr. Leonard Collmann, with Pompeian proclivity. The proscenium, which is new, is particularly elegant, and includes some figures in bas-relief. The gas, in the ceiling, is boxed in with a glass cup, so to speak, and diffuses a very agreeable and innocuous light, Messrs. Hulett & Co. being the operators. Increased space has been gained for the stalls, and the gallery, we believe, has been enlarged. The new drop-scene, by Mr. Craven, is a sparkling Greek landscape with architectural remains, and might easily be improved by a little more work: parts are crude, and the framework of frets and accordant accompaniments is very carelessly drawn, and should be revised. An act-drop, coming often before the eyes, and remaining so some time without the occurrence of acting to withdraw attention, requires more careful painting than an ordinary scene. Of the scenery for the new drama, "The Hidden Hand," we are glad to speak in warm terms. It consists of four very complete and effective architectural "sets," a vaulted chamber, a drawing-room, a bed-chamber with wall panellings and deeply recessed window, and the court-yard with loggia. The drama itself, adapted from the French, is very ingeniously constructed, highly exciting, and affords scope for some admirable acting, especially on the part of Miss Kate Terry, Mr. Henry Neville, and Miss Lydia Foot;—acting which, conjoined with the interest of the piece itself, will, we have no doubt, carry it through a long run. The new manager has certainly made a good beginning.

The New Birkenhead Theatre.—The New Theatre Royal at Birkenhead was opened last Monday night. It has been erected by a company and has cost about 9,000*l*. It is the first building of the kind having any pretensions to be a first-class place of entertainment provided for the large population of the Cheshire bank of the Mersey. The building has roomy accommodation for 1,600 persons, and is comfortably and elegantly furnished. The scenery, including the act-drop, is painted by Mr. Dalby.

Tusa, Sicily.—At the commencement of the performances at the theatre at Tusa, in Sicily, last month, two rows of the boxes fell with a great crash. After the rubbish had been cleared away by the soldiers who were called in to assist, two persons were found to be dead, and several severely wounded. We mention the circumstance as a reminder, for care.

RECENT PATENTS CONNECTED WITH BUILDING.*

Heating Buildings by means of Hot Water *G. H. Tiers.* Dated 29th May, 1863.—This invention consists in a furnace with a suitable flue, and a boiler with flow and return pipes, the furnace being provided with a self-acting feeder, which, by means of clockwork supplies the requisite amount of coal or fuel to the fire at any fixed time of the day or night. The boiler is of conical shape, with the feeding door placed in the usual position. The flue, instead of being at the side or back, is at the top, taking any turns required by the form of the building to which it is applied. The flow-pipe is, in proportion to the flue, as large again, and contains the flue to the length of the building. The object of the flue passing through the flow-pipe is, that all heat generated within the boiler will be turned to account in the course of the draught, coming in contact with a large portion of metal surrounded by water. A damper is placed just above the end of the flow-pipe, so that when the fuel is well lit up, the heat may be regulated. The feeder is a box or spout, of a semicircular shape, about 1 foot in length, with an opening in the flat side, about 1 inch from the front of the boiler, into which fits a sliding door, with a trap to fill over the orifice when the slide is withdrawn. Into this box the requisite quantity of coal or fuel is placed, and the feeder is then closed by a door. At any time of the day or night to which the clockwork may be set, a cord connected to the clockwork acts on a catch, which action will release the end of a lever, to which a weight is attached, which in its descent lifts the sliding-door in the feeder, and allows the coal in the feeder to slip into the furnace or cavity of the boiler.

Bricks.—*G. H. Cottam.* Dated 2nd June, 1863.—In making bricks for paving stables and other places, the patentee forms the bricks of an oblong shape, as heretofore, but, in place of making the bricks deeper than they are wide, he forms them square in transverse section, so that, in laying them, either side may be placed uppermost. They can also be made in cube blocks, to use all sides alike, when required for paving stable-yards, or at the backs of stalls; all the edges of the bricks are also bevelled, so that, whichever side of the bricks is placed uppermost, there will always be a hollow space between the upper surfaces of two neighbouring bricks. They can also be made without the bevelled edges, so as to form a plain surface.

Construction of Fan Blowers for Ventilating and other Purposes.—*W. E. Newton.* A communication. Dated 20th November, 1863.—This invention consists in gathering and expelling from an apartment of any kind the foul air or gases, and at the same time, and by the same apparatus, drawing in fresh air from without, and forcing it into the apartment to supply the place of that expelled, thus doing two things at the same time, or by one and the same operation, both of which are essential to a speedy change of air in the apartment to be ventilated.

Machinery for Making Bricks and other like Articles.—*W. Williams.* Dated 21st November, 1863.—The patentee constructs a trough or framework of cast-iron or other rigid material, preferably of a circular form, with openings in the bottom corresponding in shape to the bricks or articles to be made. Between and above these openings there are transverse pieces, which join the sides together, so that the trough or framework, when ready for use, resembles, and may be said to consist of, a series of small hoppers. A roller, similar to an edge-runner, to which he affixes projecting pieces, to fit into the hopper-shaped spaces, is made to travel over and in the said trough or framework, and press the clay or other plastic material, supplied to the trough or frame by hand or otherwise, through the openings in the bottom, into moulds placed just under such opening. The roller can be made to travel by any suitable means: a horse could be yoked to the lever or arm coupled to the roller in the usual way, the other end of such lever or arm being connected to an upright shaft resting in a step placed in the middle of the circle described by the trough or framework.

Constructing the Floors of Bridges, Houses, &c.—*E. Finch.* Dated 21st November, 1863.—For the purposes of this invention, in forming a floor, girders or beams, by preference of wrought iron, and constructed as heretofore, are used, but other construction of girders, whether of iron or other materials, may be employed. On these girders or beams bars of T-iron are fixed parallel to each other by riveting or otherwise; or bars of bridge or trough iron, or of angle iron, or bars of other forms may be similarly used in place of bars of T-iron, so long as they are suitable for having the edges of sheet-iron or steel fixed thereto. When using T-iron, the sheets or plates are cut somewhat wider than the spaces they have to fill, and they are slightly curved or bent, and spring into the spaces between the bars of the T-iron, and are there fixed by keys passed through holes formed at intervals in the limb or leg of the T-iron, the head of the T-iron bars being fixed to the beams or girders by riveting or otherwise. This insulating surface is covered with concrete, asphalte, or other suitable material, and over that stone or other flooring is applied. When using bars of other forms, the edges of the bent plates or sheets are fixed to the angle or sides of such bars by riveting: in other respects the construction of a floor is as before described.

Books Received.

VARIORUM.

"The Simplicity of the Creation." By William Adolph. Second and enlarged edition. London: Burns & Lambert, Paternoster-row. 1864. The orthodox science of astronomy is undergoing so many modifications, from within as well as from without, in these more and more heterodox and self-asserting times, that soon it will be difficult to draw the line between its pure orthodoxy and its mere heterodoxy, and we shall have to take refuge in the Scottish blacksmith's sarcastic and long-headed definition of the distinction between the two: "When your doxy and my doxy 'grees,—that's orthodoxy; but when your doxy and my doxy differs, weel—that's heterodoxy." Mr. Adolph's very ingenious and original disquisition certainly differs not a little from other doxies,—both ortho- and hetero-doxies,—both from the Hinds and from the Gumpachs of astronomical science; but, as we have before said, we hail with pleasure every new blow at the old idol whose worship has become a superstition; and it is not necessary that we should quite agree with every new-comer, in order that we may enjoy each successive blow. We are only pleased to think that good and truth cannot but come out of the *mêlée* at last. In regard to Mr. Adolph's speculations, which, as he informs his readers in the preface, first of all originated in a theory of the tides to which we gave a place in the *Builder*, it is to be regretted, we think, that he did not take the advice kindly given him, not to mix up doctrinal points connected with one special form of religion with his scientific speculations. Even the more scientific and enlightened members of his own church, we feel assured, would have preferred his not doing so, however conscientious and excusable his motives. As it is, however, this suggestive volume will be found to contain much food for wholesome rumination on very sublime and interesting subjects.——"Introduction to the Science of Wealth," by W. H. Daniels (Hardwicke), is the title of a *brochure* on political economy, that discusses questions of rent, supply and demand, and profit, in a way to incite thought.——A little volume of fun, reminding the reader of the well-known "Comic Annual," will shortly be published under the title of "Vere Vereker's Vengeance: a Sensation." The illustrations, we believe, will be quite as *à propos* to the text as those to be met with in some other recent works. They cannot well be less so. The author is Mr. Thomas Hood.

Miscellanea.

The Higham Ferrers Brasses.—Who is it that has been moving the brasses in Higham Church? Why could they not be let alone?

Monumental.—The monument to Melancthon was to be inaugurated at Bretton, in the Grand Duchy of Baden, on the 30th of October. This monument has been prepared in Berlin by the well-known sculptor Professor Drake.

Iron Defences for Russia.—Not long ago we were very anxious to knock about the forts of Cronstadt. Now English iron-workers are supplying the Russian Government with enormous iron defences for the said forts. Accommodating John Bull!

Sanitary State of Croydon.—According to the quarterly report 170 deaths were registered in the parish in the quarter ending 30th September last,—being at the rate of 19¼ (per annum) in the thousand of the population, now estimated at 35,332. This is very slightly above the average of the last ten years, without allowing for any increase of population since the commencement of the year. In the less populous districts the mortality has been very low; and only at a comparatively high standard in the central district, including the union house.

Architectural Association Voluntary Examination Class.—The meetings of this class have recommenced. On Tuesday next, the 8th instant, Mr. Thos. Blashill, the president, will give a paper on "Iron and Ironwork." A syllabus of the papers up to January next will be found in the annual publication of the Society.

Ancient Bristol: Discovery of Old Paintings.—Bristol is rich in old and curious houses. The office of the *Mirror*, in Small-street, is celebrated as the house of Colston the philanthropist, and has many curious carvings, ancient chimney-pieces, and open roofs. It appears that portraits of Mrs. Paul Bush, Newton, and Smalridge, Bishops of Bristol, were presented to the late Bishop Monk by Archdeacon Thorp, but that they have been missing ever since Bishop Monk's death. They have now been discovered, however, by Bishop Ellicott, under some old packing-cases in a cellar.

The Main Drainage and Thames Embankment Contract.—At a meeting of the Vestry of St. James's, Westminster, Mr. Beal moved a resolution to the effect that it is essential, having reference to the grave charges made against the management, by the Metropolitan Board of Works, of the Main Drainage and Thames Embankment works entrusted to it, that a full inquiry under the Government should be made through the medium of a Royal commission. After some discussion the meeting was adjourned for further consideration of the subject.

Gas-Meter Company (Limited). — At the second annual meeting of this company a dividend was declared at the rate of 6 per cent. per annum for the last half-year, and for the same period a bonus at the rate of 6 per cent. per annum, leaving a balance of profit undivided of 687*l*. The company have completed arrangements for the more accurate formation of dry gas-meters by machinery, for which they have a patent. The report states that 13,000 of their unvarying water-line gas-meters" (Sanders & Donovan's patent) are at present in use. The consulting engineer of the company, Mr. T. G. Barlow, has reported to the directors on the dry-meter machinery. Mr. A. A. Croll, one of the directors, has retired by rotation, but has been re-elected.

Progress at San Francisco.—As an evidence of progress at San Francisco, we may mention that the "Cosmopolitan Hotel," a building on a large scale, has been opened. It stands at the corner of Sansome and Bush streets, and occupies one site of the old Rassette House, afterwards known as the Metropolitan Hotel, covers a full 50-vara lot, and has therefore a frontage of 137½ ft. on both Bush and Sansome streets, and of the same number of feet either way in depth. The building has a full basement, four full stories above, and an attic with rooms as spacious as those in an ordinary first-class dwelling. The clear space between the floors and ceilings of the rooms on the different floors are as follows:—Basement, 9 ft.; first, or main story, 17 ft.; second story, 14½ ft.; third story, 12½ ft.; fourth story, 11 ft.; attic, 10 ft. The building is in the modern French style. The cost of erection was 250,000 dollars.

The Utilization of Sewage at Carlisle.—"Every one in Carlisle," says the local *Journal*, in allusion to the visit *en masse* of the Metropolitan Board, "will admit that Mr. M'Dougall's sewage experiments, here as elsewhere, have proved a decided success. When did the holmes he rents ever bear, before he leased them, anything like such crops as they have borne since? And who, when the sun shone brightest on Carlisle wall, was annoyed by the slightest whiff of malodour from Mr. M'Dougall's meadows? The old-fashioned prophets of evil, who have croaked over liquid manure like a chorus of frogs, have had all their predictions falsified. The visitors from London could not have come to a better place than Carlisle to convince them, or to confirm their conviction, that town sewage can be used for agricultural purposes with great pecuniary profit, and without any sanitary detriment;—that it is a most powerful fertilizer, and can be thoroughly deodorized and disinfected. We heartily rejoice over the success of the local experiment, not merely for local reasons, but because we hope and believe that it will be instrumental in bringing about a sewage reform of almost incalculable national importance." The Metropolitan Board have since been at Carlisle, as already noticed, and afterwards went on to Edinburgh and Glasgow.

Fever at Woodditton, Newmarket.—There are several bad cases of fever and scarlatina raging in this village; caused, it is supposed, through the use, for domestic purposes, of shockingly impure water, and a want of sufficient accommodation and ventilation in the cottages. The Duke of Rutland has given directions for the immediate removal of some families into new and commodious cottages recently finished, and has ordered that those in which they are now living shall be at once pulled down. The duke has intimated his intention to erect other comfortable cottages, and to have wells sunk in various parts of this extensive parish.

Communication between Passengers and Guards in Trains.—Another of the innumerable suggestions for this purpose has been provisionally protected under the title of "New or Improved Arrangement or Mechanism for Communicating between any Passenger and the Guard and Engine-driver of a Railway Train." It consists simply of a pair of arms or shutters, fitted with springs, and affixed to the outside of each compartment of a railway carriage, which arms are held in their positions by a rod passing over the seat. This rod is made sufficiently strong to prevent any person injuring the signal, which, when required in case of accident or otherwise, needs only to be moved in either direction from within the carriage, when the arm or shutter is immediately disengaged, and stands out at right angles to the side of the carriage, so that it can readily be seen by the driver in front, or by the guard at the rear of the train. The carriage-lamp will in this case be situate at the side, and a glazed opening will be made to allow the light to be reflected on both sides of the shutter or arm when disengaged, thus showing the signal at night as readily as in the daytime. The plan is simple enough, but it is not from want of simple enough arrangements that communication between passengers and guards has not yet been made on railways.

New Park for Preston.—At a recent meeting of the Preston town council, Mr. Alderman Miller intimated his intention of presenting to the town a plot of ground for a public park. Already Preston has one park, in Avenham Valley, which has just been laid out by Mr. Milner, the landscape gardener. The ground given by Mr. Miller adjoins that in Avenham Valley, and will be connected with the park recently formed by roads, &c. Mr. Miller has given between 2,000*l*. and 3,000*l*. for the land. The gift is made subject to this condition—viz., that the corporation shall make a yearly grant of 40*l*. for the benefit of the Preston Grammar School. The money will be appropriated in the foundation of a scholastic exhibition. Immediately after Mr. Alderman Miller had made the presentation, and had received the thanks and eulogy of the council, the town clerk announced that legal proceedings were to be taken against Mr. Miller because his mill furnaces did not consume their own smoke. This announcement naturally created rather an odd sensation of surprise among the members of the council.

The Tomb of an Ancient Briton.—A barrow has been opened near to Seale House, Rylstone. The tumulus was 31 ft. in diameter and about 7 ft. high, and situate in a meadow. It was opened from the south-east, and immediately under the sod was found to consist of yellow clay to a considerable depth; then came layers of blue clay, which had evidently been puddled, or worked to a finer consistency, doubtless to keep out the water. Exactly in the centre of the tumulus, at a depth of 7 ft., and on a level with the plane of the field, was found an oak coffin formed out of a tree which had been split and hollowed out, and placed due north and south, the head being placed to the south, as that was the larger part of the tree. After being exposed to the air for about ten minutes it parted at the sides, and it was found impossible to move it except by detached pieces. The body had been wrapped in a cloth or shroud of a texture resembling wool coarsely woven, of which there was a considerable quantity remaining, but the body itself was dissolved by the action of water. The Rev. Mr. Greenwell, the antiquary, considered the interment to have been that of an ancient Briton, decidedly pre-Roman, and doubtless 2,000 years old. He said it was the only instance (with one exception, found at Gristhorp, near Scarborough) where an interment in an oak tree hollowed out had a tumulus placed over it. The coffin was more than 6 ft. in length inside, and about 7 ft. 6 in. outside.

Employment of the Lancashire Cotton Spinners.—A notice has been issued from the Public Works Office, calling upon the local authorities in the distressed cotton districts to proceed with the public works in such a way as to give employment to the largest number of indigent factory operatives, and to withhold, for the present, if needful, such works as are most productive of wages.

Industrial Ragged School for Birkenhead.—Mr. William Jackson, M.P., has undertaken to build, at Birkenhead, an Industrial Ragged School. An application for a site in the Commercial-road, Birkenhead, was made to the Liverpool town council, and the council have resolved to grant the reversionary interest for 160*l*., subject to the approval of the Lords of the Treasury, for so long as it may be used for the purposes for which it is granted.

Operative Coachmakers' Industrial Exhibition.—A large meeting of employers and operatives of the above trade was last week held at the Northern School-rooms, Castle-street, Long-acre. Mr. G. N. Hooper was appointed chairman, and stated the objects to be attained. The meeting determined on adopting the scheme after the plan of the Painter Stainers' Company; medals and certificates to be presented to the most skilled artisans in their various branches. A memorial, numerously signed by both employers and artisans was then determined on for presentation to the Worshipful Company of Coach and Coach Harness Makers of the City of London for the use of their hall.

Public Works in Ashton and Stalybridge.—The corporate seals of these two boroughs have been just affixed, at a special meeting of the council of each borough, to mortgages to the secretary of the Public Works Loan Commissioners, each for the sum of 20,000*l*., and for further advances to Ashton of not exceeding 57,500*l*., and to Stalybridge of not exceeding 62,500*l*. A great deal of this money is to be employed in carrying out the Ashton-under-Lyne and Stalybridge (Corporations) Waterworks Act, 1864. A number of cotton operatives were set to work on Monday morning in making roads and so forth at Swineshaw Brook, the site of the intended waterworks, and the number is to be gradually increased, the men being drafted from Ashton and Stalybridge, so that each borough may participate equally in the benefit of employing the factory operatives now out of work.

Rouen Art-Union.—In the year 1831 a society was formed, with the title of "*La Société des Amis des Arts*," "to aid the progress of art in Rouen, and to encourage artists by the purchase of works from the exhibitions organized by the municipal administration." The condition of membership is the payment of 30 francs on the occasion of each exhibition, and subscribers pay 10 francs each, the pictures purchased being distributed by lottery amongst both classes, every 10 francs carrying the right to a chance. For some years the exhibitions were annual, but at present they take place every second year, and, since the establishment of the society, it has purchased and distributed nearly a thousand pictures, at a cost of upwards of 180,000 francs. The exhibitions are held in the Hôtel de Ville, and the municipality votes a sum of money to cover the expenses, and another in aid of the funds of the society, or for the purchase of works of art for its own public gallery. The number of works of art in the Exhibition now open is 819, and many of those are by well-known artists.

Strikes. — The Birmingham Association of Brick Masters state that the men belonging to the Operative Brick-makers' Society of Birmingham are out on strike, "having left their employment because the masters would not turn off old hands to put on such men as the club might send them."——The nail-makers of the Lye, Cradley, and neighbouring districts, are at present much dissatisfied with some recent alterations in the rate of wages paid to them. A material fall in the rate of wages has led, it is said, to a nailer's earnings being reduced so that he can only get 16*s*. where he formerly got 1*l*. Within the last month, however, the masters have taken 1*d*. off the hob-nails, as compared with the July list; and, in addition to this, one master took 10 per cent. off the "thousand" work; but, owing to remonstrances by the union, this has been stopped. Intimations are now said to have been made that another drop on the "hundred" work and on the "hobs" will take place. Should this occur, it will lead to a general strike.

PROPOSED METROPOLITAN TRADES HALL.—Endeavours are being made to obtain a building in the metropolis for working men's friendly, co-operative, trade, and other meetings. The purchase of St. Martin's Hall for the purpose has been suggested.

VALUE OF LAND AT WINDSOR.—Last week the site of the late royal stables at Windsor, purchased of the Crown by the Great Western Railway Company about twenty years ago, which has been lying waste ever since that period, was submitted to auction, at the Castle Hotel, by Farebrother, Clark, & Lye, first as a whole (about two acres), but 3,550*l.* being the only offer, it was withdrawn, and afterwards submitted in thirteen lots, averaging from 30 ft. to 40 ft. frontage, and about 100 ft. in depth. Only three lots were sold, the reserved price appearing to be about 10*l.* per square foot frontage.

A NOVELTY IN CHAPEL-BUILDING.—A Scotch paper records the opening of a new Baptist chapel, every stone of which has been quarried by the hands of the minister. It is on the island of Lismore, standing almost in the middle of Loch Lhinne, and the minister is Alexander Livingston, one of the agents of the Baptist Missionary Society for Scotland. He has not only given the site, but, to lessen the expense, has with his own hands quarried every stone, besides assisting as a labourer to the workmen. It is 30 ft. long and 20 ft. wide, and comfortably seated for 150 persons.

INFLUENCE OF IRON ON VEGETATION. — A curious discovery, it is said, has recently been made regarding the influence of iron on vegetables. On the chalky shores of France and England, where there is an absence of iron, vegetation has a sere and blanched appearance. This is removed, it appears, by the application of a solution of the sulphate of iron. Haricot beans watered with this substance acquired an additional weight of 60 per cent. Mulberries, peaches, pears, vines, and wheat derived advantages from the same treatment. In the cultivation of clover wonderful advantages have been gained by the application of sulphate of iron on soils where it is desired to produce an early crop. No fruit is so much benefited by iron rust in soils as the pear. So says a New York paper; but we have always understood that iron was rather a sign of barrenness in a soil; and were not aware that the juices of plants, like the blood of animals, derived benefit from iron; which, however, has been regarded as preeminently a vital metal, as respects animal life.

WORKMEN'S DWELLINGS, PARIS. — A correspondent of the *Morning Post*, writing on this subject, says,—"The attention of the Emperor has been directed to some of the pieces of land which have been severed by the construction of the new streets, particularly in the outskirts of the town, where land is of less value. I have just seen the Cité Ouvrière, in the new street, Rue de Campagne Première, leading out of the Rue d'Enfer. This consists of a number of very neat houses, only three stories above the ground-floor, and with two sets of apartments in each. They are inhabited by 600 people, and produce a revenue of 45,000 fr., or 1,800*l.*, a year. Each set has a sitting-room, about 12 ft. square, one bedroom only, and a small kitchen. The height of every story is 2½ metres, or nearly 9 ft. Gas and water are laid on, and there are conveniences for stowing wood, &c. Each set lets for 250 fr., or about 10*l.*, per annum. Although deficient in accommodation, to our English notions, they are a great improvement on the garret and cellar system. The rent is paid readily, and there was not one single apartment to let when I went over the place. But by far better than these are a large row of dwellings which are now in progress by a very public-spirited and enterprising individual, M. Garand, in the Rue Popincourt, Faubourg St. Antoine. They are from the designs of M. Oslin. There are four sets of apartments on each floor, consisting of three rooms and a kitchen, with every convenience. These, though much larger and more commodious than those formerly described, can be let for 300 fr., or 12*l.*, per annum. The principal room is 14 ft. by 12 ft., and 9 ft. high. On the upper or fifth floor are to be, as I understand, single rooms for bachelors, which are to be let furnished for 20 fr. a month, or 9*l.* 12s. per annum. In a country where so much is done by Government, and so little by private enterprise, it is with great pleasure I record the name of M. Garand as a great and worthy benefactor to the industrious classes of Paris.

WORKINGTON WET DOCK.—The walls of the new wet dock at Workington prove to be of insufficient height to admit of vessels loading from the hurries. The blunder, which is a somewhat serious one, is Mr. Rendell's, and the expense of the alterations which will have to be made before the dock can be used is likely to be considerable, as the sides of the dock will have to be heightened to the extent of some 6 ft.—*Whitehaven News.*

ENORMOUS CASTING, SHEFFIELD.—It may be in the recollection of our readers that in July last a successful attempt was made by Messrs. J. M. Stanley & Co., the Midland Works, to cast an anvil block weighing 160 tons. The enormous mass of iron took six weeks to cool, and it was then, by means of hydraulic power, lifted from the mould. Last week the same firm were engaged in casting a second anvil of precisely the same size and weight. The mould, which was 12 ft. square at the base and 11 ft. 6 in. deep, was dug out in the centre of the workshop, and from the five furnaces constructed at intervals round the building, the molten iron was run. The first furnace was "tapped" at six o'clock in the morning, and in about twelve hours the mould was filled.

PROPOSED RAILWAY BRIDGE OVER THE TAY.—A meeting of the principal inhabitants of Dundee has been held to consider a proposal to form a high-level bridge across the Firth of Tay. Mr. Dodds, Parliamentary solicitor, stated that the scheme was brought forward in connexion with a proposed bridge over the Forth above Queensferry. Mr. Bouch, C.E., stated that a line was intended to run along the south shore of the Firth, from Tayport to Newport (about two miles and a half), from which it would cross to Dundee on a lattice girder bridge, about two miles in length with a single line of rails. A double line would run nearly a mile through the town on arches to the general station, where the North British would join the Scottish North-Eastern. The estimate was, for the Tayport line, 70,000*l.*; the bridge, 180,000*l.*; the junction line, 100,000*l.*—in all, 350,000*l.* The Forth bridge would cost about three times that of the Tay bridge. The southern and east coast companies were to build the Forth bridge, and would also give aid to the Tay bridge, but it was hoped the people of Dundee would show their interest in the scheme by subscribing part of the capital. The bridge would be finished in about two years. It would not, being above the port and harbour of Dundee, interfere with the navigation, its elevation being about 100 ft. above the fairway at high water, the same height as the Britannia bridge, reduced at the ends by an incline on either side to 70 ft. The meeting expressed general approval of the object, and appointed a committee to consider the scheme maturely and report upon it.

COST OF PUBLIC WORKS AND HIGHWAYS AT STOCKPORT.—It appears from an official statement of the expenditure by the corporation on public works from October 21, 1863, to October 20, 1864, that the amount paid for skilled labour has been 727*l.* 13s. 1d., against 5,319*l.* 15s. 3d. for unskilled: 3,124*l.* 14s. 11½d. had been paid for carting, stonework, brickwork, lime and cement, pipes, blocks, bends, inverts, &c., and timber; and 2,617*l.* 10s. 8d., for sundries, including pump, asphalte boiler, salaries, stationery, smithwork, and the purchase of Messrs. Rostron's property;—making a total of 13,779*l.* 13s. 11½d. From this must be deducted the cost of Carrington road, 802*l.* 17s. 1d.; leaving the total actual cost of sewerage works 12,976*l.* 16s. 10½d. The expenditure on the highways during the same period is 1,166*l.* 17s. for skilled labour; 671*l.* 8s. 2d. for unskilled; carting, 819*l.* 4s. 3d.; stone, sets and flags, 920*l.* 18s. 9d.; pitch, gravel, coal, smithwork, working plant, lime, timber, and joiners' work, 614*l.* 3s. 1d.; sundries, stationery, &c., 101*l.* 11s. 1d.;—or a total of 4,062*l.* 3s. 5d.

TENDERS.

For new tavern in Union-road, New Wandsworth, for Mr. Fred. White. Quantities not supplied:—

Braithwaite	£474 0 0
Stimpson	470 0 0
Adamson	439 0 0
Lathey, Brothers (accepted)	423 0 0

For the erection of dwelling, shop, and warehouse, in Rampant Horse-street, Norwich, for Mr. T. Priest. Mr. James S. Benest, architect. Quantities supplied:—

Lacey	£1,160 0 0
Balls	1,076 0 0
Gilbert	1,060 0 0
Taylor	1,059 0 0
Wales (accepted)	1,020 0 0

For the Boys' Hospital School, for the Norwich Charity Trustees. Mr. James S. Benest, architect. Quantities supplied:—

Bocking	£613 10 0
Plummer & Bloom	482 10 0
Downing	478 5 3
Wright	469 0 0
Lacey	467 0 0
Browne & Bailey	459 0 0
Spinks	448 0 0
Youngs	447 0 0
Taylor	430 0 0
Murray & Son (accepted)	420 0 0

For new foundry, Teesdale Iron Works. Mr. Charles J. Adams, architect:—

Noble (accepted)	£1,923 11 6

For park-wall and entrance-gates near Edmondthorpe Hall. Mr. R. W. Johnson, architect:—

Halliday & Cave	£645 0 0
Clarke & Co.	609 0 0

For new farm steading, and repairs and additions to house at Horninghold, on the estate of Mr. T. Chamberlayne. Mr. R. W. Johnson, architect:—

Porter	£2,077 0 0
Mason	2,040 0 0
Clifton	2,013 0 0
Fast	1,970 0 0

For repairs to 19, Southampton-street, Bloomsbury, and warehouse in rear thereof, for Mr. J. W. Hollebone. Mr. P. W. Willis, architect.—

Deards	£5,273 0 0
Carter & Sons	5,216 0 0
Patrick	5,185 0 0
Mathews	4,728 0 0
Henshaw	4,656 0 0

For the erection of offices and stores in connexion with Woodside Ferry, Birkenhead. Mr. T. C. Thorburn, architect. Quantities by Mr. W. M. Boden:—

Campbell	£4,231 0 0
Cameron	3,998 11 5
Dobson	3,993 18 0
Lund	3,992 8 7
Ellis	3,560 0 0
Wright	3,500 0 0
Bleakley	3,470 0 0
Hogarth (accepted)	3,349 13 7

For new Board-room and offices for the Guardians of the Parish of St. Matthew, Bethnal-green. Mr. E. N. Clifton, architect. Quantities supplied by Messrs. Williams & Schofield:—

Hill & Keddell (accepted)	£5,525 0 0

For public-house at Bracknell, Berks, for Mr. Allaway. Mr. Jos. Morris, architect:—

Norris (Jas.)	£720 0 0
Grover	602 0 0
Sheppard	599 0 0
Norris	544 0 0
Winter	540 0 0
Simmonds	510 0 0
Matthews	504 13 0
Kearvell	502 0 0
Biggs	499 0 0
Kempsell	449 0 0
Hipperson & Bryard	444 0 0
Lawrence	437 16 0
Pither	428 6 0
Reavell & Sons	394 0 0
Woodwell (accepted)	370 0 0

For public-house, Grey Friars, Reading, for Mr. Allaway. Mr. Jos. Morris, architect:—

Strong	£1,136 0 0
Woodroffe	1,100 0 0
Dunn	1,091 0 0
Wheeler & Sons	1,080 0 0
Matthews	1,077 0 0
Norris	1,064 0 0
Biggs	1,015 0 0
Kendall	1,005 0 0
Grover	995 0 0
Winter	980 0 0
Sheppard	945 0 0
Simmonds	908 0 0
Reavell & Sons	938 0 0
Barnicoat (accepted)	919 0 0

TO CORRESPONDENTS.

T. M. R.—C. H. G—Clervaux House (the foundations, we are told, are being put in. The statement that the building was in progress came from the architect; to whom any further inquiries must be addressed).—T. R. M.—B. D. (name illegible. A man who habitually signs his name so that it cannot be read is a public nuisance).—T. H.—A Fitter (we have not).—Centrifugal Railway (yes. Never heard there was any overturn).—M. E. KELLY'S PRACTICAL BUILDERS' PRICE-BOOK; or, Safe Guide to the Valuation of all kinds of Artificers' Work; with the Modern Practice of Measuring, and an Abstract of the New Building Act for regulating the Construction of Buildings. Revised and Corrected by New Calculations upon the present Value of Materials and Labour. Arranged by an Architect of experience, assisted by several experienced Measuring Surveyors. Illustrated and exemplified by Steel Engravings and numerous Woodcuts in Outline. 8vo. price 8s. neatly bound.

London: published by T. KELLY, Paternoster row; SIMPKIN and MARSHALL; and may be had of all Booksellers.

Of whom may be had, New Editions in Quarto, of the following Practical Architectural Works:—

1. PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, and CABINET-MAKING, Revised by TREDGOLD: being a new and complete System of Lines, for the Use of Workmen; founded on Geometrical and Mechanical Principles. In parts at 3s. or in boards, 30s., containing upwards of 120 Steel Plates, and numerous Woodcut Diagrams.

2. PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, and PLASTERING (revised by TREDGOLD), both plain and ornamental; containing a new and complete System of Lines for Stone Cutting, for the Use of Workmen; the Composition of Mortars, Cements, Concrete, to which is added a variety of new designs for Mural Tablets, Tombs, Gravestones for Cemeteries, &c. &c.; and a description of the various materials employed. Ten Parts at 3s. or in boards, 30s.; containing upwards of Ninety Steel Plates and Numerous Woodcuts.

3. TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE: containing plain and simple Rules for Drawing and Executing them in the purest style; including an historical Description of Gothic Architecture. Illustrated by upwards of One Hundred Steel Engravings, executed by Artists of first-rate talent, including numerous Diagrams, &c. Twelve parts at 3s.; or in boards, 36s.

4. DESIGNS for COTTAGE and VILLA ARCHITECTURE: containing Plans, Elevations, Sections, Perspective Views, and Details, for the Erection of Cottages and Villas. By S. H. BROOKS, Architect. Beautifully engraved in outline on steel, with Directions for Building, and the estimated Cost of each Edifice. Twelve parts at 3s.; or in boards, 38s.

5. DESIGNS for PUBLIC BUILDINGS, consisting of Plans, Elevations, Sections, Perspective Views and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other building for public purposes. By S. H. BROOKS, Architect. Beautifully engraved on steel. Ten Parts, at 3s. or 32s. boards.

6. THE HOUSE DECORATOR and PAINTER'S GUIDE: containing a series of Designs for Decorating Apartments with taste, and adapted to the various styles of Architecture. By W. and A. ARROWSMITH, House Decorators to her Majesty. Ten parts, at 3s.; or in boards, 26s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION: containing a complete Treatise on the Art of House Painting, Graining, and Marbling; including the Origin of Colour, the Laws of Harmonious Colouring, the Manufacture of Pigments, Oils, Varnishes, &c. By W. M. HIGGINS, Esq. Accompanied by actual Specimens of Hand Brush Graining and Marbling. Ten parts, at 3s.; or in boards, 32s.

THE ENGINEERS' and MECHANICS' CYCLOPEDIA, a new and enlarged edition, comprehending Practical Illustrations of the Machinery and Processes employed in every description of Manufacture of the British Empire. By the late W. HOWARD. Upwards of 2,000 Wood Engravings. By LUKE HERBERT, Civil Engineer, &c. The rapid progress of Mechanical Science has developed many of the important facts since the first publication, in 1835, of the Encyclopedia. The inventions and discoveries recently made have engaged the sedulous attention of the Editor; for, as the value of each has been tested by experiment, a description was accordingly prepared. By a selection of new articles, and care in the revision of old ones, this edition has now become systematically enriched; so that it may be referred to as a faithful and faithfully expressing "the existing state of Engineering and Mechanism, as adapted to the wants of Practical Men." In two large 8vo volumes, cloth, lettered, price 30s.

Albemarle-street, Nov. 1, 1864.

R. LANGLEY, Agent

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr ROBERT WHITE, and which may be seen in operation at the Brickfields of
J. B. WHITE & BROTHERS, Erith, Kent.
The advantages of this plan are two fold.
1st. Nearly all the bricks are laid into stocks, and the yield from her burnt brick is reduced from 35 to about 17 per cent of the total make, which in itself represents a large pecuniary saving.
2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.
Licenses for use of the Patent granted to Brickmakers, on application to the Patentees 17, Millbank street, Westminster.

FRENCH POLISHING.—Ships' Cabins, Staircases, and all kinds of Furniture CLEANED and POLISHED equal to new. All work insured in case of fire. W. BOREWOOD, 131, Curtain Street-road, St. George's in the East.

GUTTA-PERCHA MILL-BANDS.—The Gutta-Percha Company beg to state that the increasing demand for the Gutta-Percha Strapping for Driving-bands, Lathestraps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractibility and uniformity of substance; their non susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 2 to 30 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Bosses, Union joints, Flasks, Bottles, Bowls, Toilet trays, Cartridge-case, Galvanic Batteries, Tobotypes Trays, &c. &c. manufactured by the Gutta Percha Company, and sold by their Wholesale Dealers in town and country.

J. B. WHITE & BROTHERS,

CEMENT MANUFACTURERS,

BRICKMAKERS, &c.

For Account of Experiments on the Strength of their

PORTLAND CEMENT,

Read at the Institute of Civil Engineers, apply to the Makers.

KEENE'S IMPROVED CEMENT,

Manufactured only by J. B. WHITE and BROTHERS, specially adapted for SKIRTINGS FLOORING, and INTERNAL STUCCO, on account of its superior hardness.

N.B. Can be Painted in Twenty-four Hours.

MILLBANK STREET, WESTMINSTER.

LIVERPOOL, 42, SEEL STREET.

MARTIN'S CEMENT,

Prize Medal, 1851. Honourable Mention, 1862.

THE MOST APPROVED INTERNAL STUCCO.

CAN BE PAINTED IN TWELVE HOURS.

J. C. PART, MANUFACTURER,

181, DRURY LANE, LONDON; and at DERBY.

THE BEST PLASTER OF PARIS. ESTABLISHED 1784.

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and

pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.—2nd. It is portable, being packed in rolls, and not liable to damage in carriage.—3rd. It effects a saving of half the timber usually required.—4th. It can be easily applied by any unpractised person.—5th. From its lightness, weighing only about 43 lbs. to the square of 100 feet, the cost of carriage is small.—6th. Under slate, metal, or tiles, it is a most effective non-conductor.

INODOROUS FELT, for damp walls and for damp floors, under carpets and floor cloths. Price ONE PENNY per Square Foot.

CROGGON and CO.'S PATENT FELTED SHEATHING, for Covering Ships' Bottoms, &c. and preventing the radiation of Heat, saving 25 per cent. of Fuel, and deadening Sound.

DRY HAIR FELT, for Covering Steam Boilers, Pipes, &c.

Samples, testimonials, and full instructions, on application to

CROGGON & CO. 2, DOWGATE HILL, LONDON; 2, GOREE PIAZZA, LIVERPOOL; And 59, GEORGE SQUARE, GLASGOW.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. Which is sold under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with SIX gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,

WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

MINTON & CO.

HAVE REMOVED FROM ALBION PLACE, BLACKFRIARS, TO 39, CONDUIT STREET, REGENT STREET.

ENCAUSTIC AND OTHER PAVEMENTS.

EARTHENWARE AND PLAIN TILES.

DESIGNS AND ESTIMATES PREPARED.

MANUFACTORY, STOKE-UPON-TRENT.

PARIAN CEMENT for INSIDE WORK.

With this Material Houses may be finished and occupied in one-fourth the usual time, as Parian Stucco may be painted or papered within forty-eight hours. A finer quality produces a beautiful and hard sculptural imitation of marble.—Manufacturers, FRANCIS, BROTHERS, & POTT, Nine Elms, London.

PURE HYDRAULIC LIME, Manufactured

from the best HALKIN MOUNTAIN LIMESTONE, same as supplied for the construction of the Liverpool and Birkenhead Docks.

The HOLYWELL LIMESTONE COMPANY are prepared to deliver the above, in lump or ground, packed in bags, into waggons, at the Holywell Station of the Chester and Holyhead Railway, or on board vessels at Greenfield Wharf, Chester River.

Prices and particulars furnished on application to Mr. EVAN EVANS, Manager, Parry's Mine Works, Holywell, Flintshire.

The Company guarantee the quality of the Lime to be equal to that used by the Engineer of the Liverpool and Birkenhead Docks,

Agents wanted. No applications attended to without a banker's reference.

BURHAM BRICK, LIME, and CEMENT

COMPANY, BURHAM WHARF, BELVIDERE-ROAD, LAMBETH.—The public are informed that the Company have taken the above Premises, and have ON SALE, GAULT BRICKS, TILES, POTTERY, DRAIN-PIPES, GREY STONE LIME, PORTLAND and other CEMENTS, and BUILDING MATERIALS of all descriptions. Architects and Builders are respectfully informed that goods of any pattern or design can be manufactured at the Company's Works, erected on the banks of the Medway by the late Thomas Cubitt. They would also call the attention of the public to the very superior quality of their Portland Cement.

STOURBRIDGE FIRE-CLAY WORKS.

LIME BURNERS,
BRICK MAKERS,
SLATE, TILE, DRAIN-PIPE, HAIR, LATH, and FIRE GOODS MERCHANTS.

ST. JAMES'S and THORNHILL WHARFS,
CALEDONIAN ROAD, LONDON.

ROMAN CEMENT made at the above works may be had fresh from the kilns daily,—a great advantage to dealers and sewer contractors, especially in winter time.

PORTLAND CEMENT, of the best quality, strength, and colour, manufactured at Kent. This cement will carry more sand than any other cement, so much of which is now brought into the market and sold as Portland.

PLASTER OF PARIS, both coarse and fine, of very superior quality to hair.

LIME—Grey Stone, Chalk, and Blue Lias Lime, well burnt, by the barge or yard, and may be had fresh ground daily, by steam power, for exportation.

BRICKS from our fields at Kent, by the barge alongside, in the river Thames, or by rail from the above wharf, of good quality and moderate price.

A large Assortment of Glazed Stoneware Drain pipes, Yorkshire Paving, Plain and Paving Tiles, Hair, Laths, Chimney pots, &c. always kept in stock.

BRICK-FIELDS, LIME WORKS, CHALK, FLINT, AND BALLAST WHARFS,
FRINDSBURY, near ROCHESTER, KENT.

HYDRAULIC LIME and ROMAN

CEMENT, manufactured by LLOYD JONES & CO. Halkin Works, Holywell, Flintshire. The Halkin Hydraulic Lime is the same as used in the construction of the Liverpool Docks, Manchester, and various waterworks, collieries, and mines throughout the country, being so long celebrated for its strong cementitious and connecting powers for masonry in water. Can be supplied by rail or water to any part of the kingdom, either in lump (loose), or ground, and in barrels and bags. The Limestone can be had in full cargoes, and the Cement in barrels, which is of a very superior quality and also their Cement in barrels, which is of a very superior quality and warranted pure. Orders to be accompanied by a banker's reference. Apply at the Works; or to E. & W. AARON, Agents, 63, South Johnstreet, Liverpool.

PORTLAND CEMENT WORKS.

FREEN & COMPANY,

MANUFACTURERS OF PATENT PORTLAND CEMENT, ROMAN CEMENT, AND PLASTER OF PARIS;

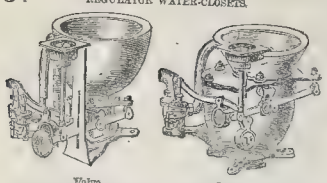
DANVER'S WHARF,
FOOT OF BATTERSEA BRIDGE, CHELSEA.

VENTILATION—PURE AIR.

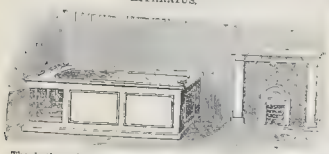
Sheringham's Day and Night Ventilator



for the admission of Pure Air

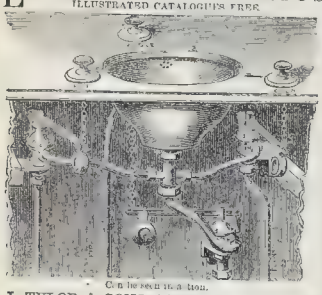
THROUGH THE EXTERNAL WALL.

These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street, Borough, London.



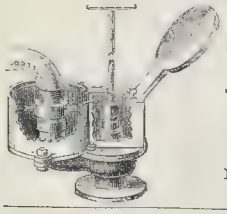
J. TYLOR & SONS' PATENT
REGULATOR WATER-CLOSETS.

Valve. Pan.



The Regulator Valve gives perfect control over the supply of water to each closet, so that, however small the fall of water, perfect flushing is insured. Any number can be worked by one cistern. No pattern-valves, conduits, or waste-pipes required. The Closets can be seen in action at the Manufactory, and Illustrated Catalogues had on application to the Makers, J. TYLOR & SONS, Warwick Lane, Newgate street, London.

J. TYLOR & SONS' PATENT BATH
APPARATUS.



The bath and boiler may be fixed in the same or separate rooms anywhere below the level of cold water cistern. Open or close fire. Pleasure No boiler. Kwork setting for boiler required.
Estimates given from architects' drawings, or by inspection of Buildings
Catalogues, containing Nine Illustrations of different methods of heating baths, sent on application to the Manufacturers, J. TYLOR & SONS, Warwick Lane, Newgate street, London.

LAVATORY APPARATUS.

INTERNATIONAL EXHIBITION, 1862.
CLASS 35, NO. 6849.
The only Medal "for Stone Ware" has been awarded to
DOULTON & WATTS, LAMBETH POTTERY,
LONDON.
In expectation of a greatly increased sale, D. & W. have determined to introduce the annexed pattern of their ENAMELLED STONEWARE CLOSET-PANS, at the price of the commonest description of earthenware.
Experience has shown that this shape is the most simple and efficient, and that in strength, durability, and cleanliness it cannot be surpassed by the most expensive closets.
FIGURE D STONEWARE CLOSET PAN AND TRAP, 3s. 9d. COMPLETE.

DOULTON'S PATENT OPERCULAR PIPES.

By the introduction of one of these Pipes, at intervals, with ordinary Socket Pipes, Drains can be examined and cleansed. The Cover, being fired in one piece with the Pipe, fits perfectly. There are no imperfect joints, or complication of parts.
Manufactured by HENRY DOULTON & CO. LAMBETH.
MANUFACTORIES—LAMBETH, LONDON; SMETHWICK, near Birmingham; and ROWLEY REGIS, STAFFORDSHIRE.

Self-Regulating Pan Closet.

THOMAS LAMBERT & SON,

Lambert's Ball Valve. High-Pressure Bib and Stop Valve.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72–74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Metal Ranges and Stoves, Cooking Utensils, &c. to meet the great public demand; and also for the consequent more extensive execution of all descriptions of hot water, bath, laundry, and steam work.

72–74, Bishopsgate street Within.

CONTRACTS.

TO BUILDERS.—BUNHILL ROW.—TENDERS are required for TAKING DOWN and RE BUILDING Nos. 114 and 115, BUNHILL ROW, and for Sundry Alterations, Additions, and Repairs, to Nos. 5 and 6, Lamb's-buildings, in the year. The drawings, specifications, and conditions may be seen on the Premises, on and after SATURDAY, the 12th instant. The lowest or any Tender will not necessarily be accepted.

CAST-IRON PIPES.—To IRONFOUNDERS. The Directors of the Dropheda Waterworks Company are prepared to receive TENDERS for the SUPPLY of PIPES, of the following diameters and lengths:—Diameter in inches, 19; length in yards, 4,100; 9 inches to 2 inches inclusive, about 18,000 yards. Specifications and forms of Tender, price 1s. may be obtained on and after the 26th instant, at the Office of Mr. MAGEE, Solicitor to the Company, Dropheda; or from Mr. T. B. FOSTER, C.E. 23, John Dalton street, Manchester. Tenders must be sent in to Mr. FOSTER on the 17th of NOVEMBER. The Directors do not bind themselves to accept the lowest or any Tender.

TO SEWER CONTRACTORS and OTHERS.—The Sewers Committee of the Vestry of the Parish of St. Mary, Newington, Surrey, will meet at the Vestry Room of the Parish Church, on FRIDAY, the 18th of NOVEMBER next, at SEVEN o'clock in the evening, to receive TENDERS for the EXECUTION of JOBBING and MEASURED WORKS in connexion with the DRAINS and SEWERS in the parish. Printed specifications and forms of Tender can be obtained at the Office of Mr. HENRY JARVIS, the Surveyor of Sewers, 20, Trinity-square, Newington, on payment of 10s. which money will be returned to the parties tendering, when the Tenders are opened. Sureties (Tenders will be received. Sureties will be required for the due performance of the contract, and the Committee do not bind themselves to accept the lowest or any other Tender.

H. & F. CHESTER,
October, 1864. Joint Clerks to the Vestry, 1, Church-row, Newington Butts.

NORTH-EASTERN RAILWAY.—DARLINGTON SECTION.—To BUILDERS. TENDERS are required for the following works, viz.:—the ERECTION of a PAIR of COTTAGES (to be built of brick), at Church-lane, at Cat-flat, and Long-beck-lane Gates, on the Redcar and Saltburn Branch: the PULLING DOWN of an old STONE COTTAGE, and the ERECTION of a PAIR of COTTAGES (to be built of stone), near Barras Station, on the South Durham Branch; the ERECTION of TWO or FOUR COTTAGES (to be built of brick), near Appleby Station, on the Eden Valley Branch. Plans and specifications may be seen on application to Mr. PEACHEY, Architect's Office, Northgate, Darlington, from MONDAY, OCTOBER 31st, to FRIDAY, NOVEMBER 11th. Tenders to be delivered at the Company's Offices, in Darlington, not later than MONDAY, the 14th NOVEMBER, 1864, addressed to the Secretary, and endorsed "Tender for Works." No pledge is given that the lowest or any Tender will be accepted.

(Signed) THOMAS MAC NAY, Secretary.
Darlington, 26th October, 1864.

MIDDLESEX COUNTY LUNATIC ASYLUM, COLNEY HATCH.—TENDERS are required for about 60 rods of RENT PALE OAK FENCING, 6 feet high, at per rod, to be put up at this Asylum Station on the Great Northern Railway, 7 miles from London, with riding to the Asylum.—Specifications to be obtained on application, personally or by letter, to the Steward at the Asylum, before the 10th of NOVEMBER. Tenders to be sent in by MONDAY, the 14th of NOVEMBER next.

CROYDON WATER WORKS.—To ENGINEERS.—CONTRACT No. 1.—Notice is hereby given, that the Croydon Local Board of Health are prepared to receive TENDERS from persons desirous of CONTRACTING with them for the CONSTRUCTION and setting to work of a Single-acting CORNISH PUMPING ENGINE, in accordance with a specification prepared by Mr. BALDWIN LATHAM, C.E. their Engineer. Such specification may be seen in the said Engineer's Office, in the Town Hall, Croydon, on or after TUESDAY, the 1st day of NOVEMBER next. Sealed Tenders, indorsed "Tender for New Steam Engine," are to be delivered at the Offices of the said Board, in the Town hall, Croydon, on or before FOUR o'clock on the afternoon of TUESDAY, the 15th of NOVEMBER. The Local Board do not bind themselves to accept the lowest or any Tender.

HENRY RICHARDS, Clerk to the Board.

CROYDON WATER WORKS.—CONTRACT No. 2.—Persons desirous of CONTRACTING with the Croydon Local Board of Health for the CONSTRUCTION of THREE SINGLE FLUED CORNISH BOILERS, in accordance with the plans and specification, prepared by Mr. BALDWIN LATHAM, C.E. the Engineer for the Local Board, can inspect such plans and specification in the Office of the said Engineer, in the Town Hall, Croydon, on or after this date. Sealed Tenders, indorsed "Tender for Boilers," are to be delivered at the Board's Offices in the Town Hall, on or before FOUR o'clock on the afternoon of TUESDAY, the 22nd day of NOVEMBER instant. The Local Board do not bind themselves to accept the lowest or any Tender.

HENRY RICHARDS, Clerk to the Board.

Croydon, November 2nd, 1864.

RIPON WATERWORKS.—The Local Board are prepared to receive TENDERS, from competent persons for the following Contracts, for the proposed new Waterworks of their district, namely,—

Contract No. 2.—Duplicate Engines, Boilers, Pumps, and Appendages.

Contract No. 4.—Excavating for Laying, and Jointing the Main Pipes and Appendages.

The specifications may be seen, and forms of Tender and other information obtained, on application to Messrs. STEVENSON & UTLEY, Engineers, Halifax; and Tenders, sealed, and marked on the outside "Waterworks: Tender for Contract No. 2" (or No. 4, as the case may be), must be sent in to me, at my Offices in Ripon, on or before THURSDAY, the 17th day of NOVEMBER instant. The Local Board do not guarantee the acceptance of the lowest or any Tender.

R. W. NICHOLSON, Town Clerk.
Ripon, 1st November 1864. and Clerk to the Local Board

CORPORATION of MANCHESTER.—To CLOCKMAKERS.—The Markets Committee are prepared to receive TENDERS for a Public TIME PIECE, to be erected on the New Pedestrian Smithfield Market, Shudehill. Drawings may be seen and Specification may be seen at the Offices of Messrs. PAULL & ANLIFFE, Architects, India-buildings, 20, Cross street, Manchester. Sealed Tenders, endorsed, "Tender for Market Clock," to be delivered at the Town Hall, on the 12th instant, before TEN o'clock, a.m.—By order.

(Signed) JOSEPH HERON, Town Clerk

Dated 9th November, 1864.

CONTRACTS.

TO BUILDERS.—Brighton Club and Norfolk Hotel Company (Limited). The time for receiving TENDERS for REBUILDING the NORFOLK HOTEL, Brighton, is POSTPONED to the 7th of JANUARY, 1865, at TWELVE o'clock. Bills of quantities may be obtained on and after the 14th of DECEMBER, at the Offices of the Architect, HORATIO GOLDY, Esq. Brighton.

TELFORD E. SHARP, Secretary.
Company's Office, Norfolk Hotel.

MARGATE.—Builders desirous of TENDERING for the ERECTION of TWO SEMI-DETACHED VILLAS at Regent-place, Margate, are requested to send their names, on or before the 15th instant, to Mr. DOUGHNEY, Architect and Surveyor, 4, Adelphi-terrace, London, W.C.

TO ENGINEERS and OTHERS.—CORPORATION BATHS and WASHHOUSES.—Persons willing to give TENDERS for the SUPPLY and FITTING UP of all BOILERS, ENGINE, DRYING CLOSETS, WASHING MACHINES, BATHS, VALVES, PIPING, and the like, required in the Corporation Baths and Washhouses now in the course of erection in Thornton-road, for the Mayor, Aldermen, and Burgesses of the Borough of Bradford, may see the plans and specifications, and obtain bills of quantities, at our Offices, from TUESDAY next, NOVEMBER 8th, until TUESDAY, NOVEMBER 15th, on which latter day, sealed Tenders, endorsed "Tender of Baths and Washhouse Fittings," are to be delivered to us not later than SIX o'clock, p.m.—By order,

MILNES & FRANCE, Architects.
30, Hall, Ince Bradford, November 3, 1864.

LANGTON CHARITIES, LEICESTERSHIRE.—To BUILDERS and OTHERS.—Persons desirous of TENDERING for the RESTORATION of the PARISH CHURCH of Church Langton, in the County of Leicester, can obtain bills of quantities on application to the Architects, Messrs. GODDARD & SON, of Leicester, from the present date up to THURSDAY, the 24th instant. The Trustees do not bind themselves to accept the lowest or any Tender.

JAS. H. DOUGLASS, Clerk to the Trustees.
Market Harborough, November 10, 1864.

TO SEWER CONTRACTORS and OTHERS.—The Vestry of the Hamlet of Mile End, Old Town, will meet at the Vestry-hall, Bancroft-road, Mile end-road, on WEDNESDAY, the 16th day of NOVEMBER inst. at SEVEN o'clock p.m. to receive TENDERS for the PERFORMANCE of certain SEWERAGE WORKS in the said hamlet. The work to be done pursuant to drawings and the terms of a specification, which may be seen at the Office of the Surveyor, at the Vestry-hall, between the hours of TEN and FOUR o'clock. The Contractor will be required to enter into a Contract to be prepared by the Clerk to the Vestry at the expense of the Contractor, not to exceed 6l. and find two sureties in the sum of 100l. for the due performance thereof. Tenders containing the names and address of proposed sureties, are to be delivered at the Office before THREE o'clock in the afternoon of the day of meeting. The Vestry do not bind themselves to accept the lowest or any Tender.

THOMAS PRICE, Clerk to the Vestry.
Vestry hall, Bancroft-road, Nov. 3, 1864.

SALE of TURRET CLOCK.—Notice is hereby given that the Secretary of State for War is prepared to receive TENDERS for the purchase of a TURRET CLOCK now in store at the Royal Arsenal, Woolwich, which may be inspected there on application to the Principal Superintendent of Stores.

The clock was made by Smith & Sons, of Cockermouth, and has four wrought-iron skeleton dials prepared for glass faces, 6 feet 4 inches in diameter.

Tenders must be made upon a proper form, which can be obtained at this Office, or from the Principal Superintendent of Stores at Woolwich, but are to be delivered at the War Office, Pall-mall, on or before the 22nd instant, addressed to the Under Secretary of State for War, and marked on the cover "Tender for the Purchase of Clock."

The Secretary of State reserves the right of rejecting any or all of the Tenders.

THOMAS HOWELL, Director of Contracts.
War Office, 5th November, 1864.

TO BRASS FOUNDERS.—The Waterworks Committee of the Corporation of Dublin, being anxious to enable the Public to take Water on Service for the high pressure water-supply about to be introduced when the new works shall have been completed, are now prepared, in accordance with the powers for the Making of Bye-laws contained in the Act for regulating and controlling the Supply of Water, to receive TENDERS, with Specimens, for the following articles, viz.:—

HIGH PRESSURE BALL-COCKS, ½, ¾, 1, and 1 inch bore, complete
HIGH PRESSURE BIB TAPS, ½, ¾, 1, and 1 inch ditto.
FERRULES, for connecting house service pipes with service mains, ½, ¾, 1, and 1 inch ditto.
BRUT-OF or STOP-COCKS, ½, ¾, and 1 inch ditto.
WATER-CLOSET VALVES, on the prevention of waste principle, fitted in cisterns, ready for action, complete.

The Waterworks Committee have not yet determined on any pattern or principle, and are resolved to select the most effective article for its special purpose. Each article sent must be accompanied by a clear explanation of the speciality of the principle of construction, clearly and of the special action, the class of metal used, the price, and the prices of the same class of article in various sizes, by the single article, by the dozen, and in large quantities; in the article patented, and such other particulars as the maker may deem advisable. The specimens are to be sent to "The Waterworks Committee," City Hall, Dublin, on or before THURSDAY, the 1st of DECEMBER 1864, and are to be returned thence to the owner when required to do so, free of all expenses to the Committee, and on the condition that the Committee may purchase any one or all of the specimens, at the prices marked, for the purposes of examination, and obtain experiments as to the efficiency of the principle and the perfection of the workmanship. The Committee will not be bound to accept the lowest or any Tender.

DUDLEY JONES DICKINSON, Secretary.
Waterworks Committee, City Hall, Dublin, 4th November, 1864.

[For remainder of Contracts see next Page.

TO BUILDERS and CAPITALISTS.—A Gentleman of high position requiring first-class SCHOLASTIC PREMISES, is desirous of opening negotiations with any one who will CONSTRUCT the same at Wimbledon and Let them to him on Lease, with the power to purchase within a period to be agreed upon. A site of from two to three acres is desired, and if the right one can be secured, it will be very easy to have premises of the description required. Plans, with their bases, may be sketched out, but the general details will be left for future arrangement.—Mr. W. R. SNELLING of 163, Fenchurch-street, London, will give the fullest information on the matter.

ST. MARY, ISLINGTON.—METROPOLIS LOCAL MANAGEMENT ACT.—The Vestry of this Parish hereby give notice, that a Committee will meet at the Vestry Office, Upper-street, Islington, on WEDNESDAY, the 23rd day of NOVEMBER next, at HALF PAST TEN o'clock in the morning, precisely, to receive TENDERS for the CONSTRUCTION of about 2,300 feet of SEWER, 3 feet 9 inches by 2 feet 6 inches, one brick in substance, and the necessary WORKS in connection therewith, in the Junction-road, Upper Holloway. The form of Tender, which alone will be received, may be obtained, and the specification and draft contract seen, at the Vestry Office (Surveyor's Department), between the hours of TEN and FOUR o'clock. Persons desirous of contracting must attend at the time and place stated, with sealed Tenders, endorsed "Tender for Sewer Works." No Tender will be received after HALF PAST TEN o'clock, nor will any Tender be received unless it contains a Bill Bank of England note, which will be immediately returned to each person whose Tender is not accepted, but will be returned in the other case only until the contract and bond are signed by the parties. The Vestry do not bind themselves to accept the lowest or any Tender, and the party whose Tender shall be accepted will be required to provide two approved sureties for the due performance of the works.

JOHN LAYTON, Vestry Clerk.
Vestry Offices, Upper-street, 16th November, 1864.

SURBITON.—To BUILDERS and OTHERS.—LAND TO BE LET, on building leases, five minutes' walk from the station, and close to the river, for houses of not less than 80l. a year rent. A portion of the money will be advanced if required.—Apply to Mr. MUDIE, Victoria-road, Surbiton.

A FREEHOLD MANSION TO BE SOLD. The elegant Furniture may be had at a valuation. There are four reception-rooms, two being 50 feet in length; eleven best bedrooms; stabling for eight horses and coach-houses for four carriages; suitable servants' offices; extensive ornamental grounds, with greenhouses, in all 28 acres; gravelly soil; near Sunningdale Station, South-Western Railway, half a mile from Windsor Great Park, and fifty minutes from the West-end Station.—Apply to J. BOWEN MAY, Esq. Solicitor, 7, Bedford-row.

WATERSIDE PREMISES, City-road.—Messrs. FULLER & HORSEY are instructed to LET, on LEASE, from Michaelmas next, extensive WATERSIDE PREMISES, occupying a site of 21,000 superficial feet, situate on the Wenlock Basin, City-road, and comprising a spacious and substantial modern brick-built manufactory of two floors, engine and boiler houses, with 50-horse power steam engine and three Cornish boilers, range of brick built offices, and paved yards with gateway entrances. There is a water frontage of about 207 feet.—For further particulars, apply to Messrs. FULLER & HORSEY, 11, Billiter-street, London, E.C.

BROWNSWOOD PARK, Green Lanes, Stoke Newington.—BUILDING LAND on the above Estate TO BE LET, for 99 years, at 4s. per foot, for the Erection of Houses about 9l. per annum. Good roads and sewers. Brick on the estate advanced cheap.—Apply to Mr. J. B. PORTER, 8, Brownswood Park.

PREMISES.—Very valuable PREMISES, situate in a main and populous neighbourhood, one mile north of the Bank, containing an area of more than 12,000 square yards, and lately occupied by a timber merchant, who realised a large fortune therein. The great scarcity of premises, owing to the increase of railways in the metropolis, renders these premises very valuable for the Wants of any one requiring large and central, valuable premises. Apply to E. & W. STURGE, Bridge Wharf, City-road, E.C.

TO BUILDERS and OTHERS.—WANTED, to RENT, in a thorough good market or seaport town, within a convenient distance of London, a comfortable DWELLING-HOUSE, with roads and premises attached, suitable for carrying on the general business of a builder. The advertiser would not object to take to a fair amount of stock-in-trade. Unexceptionable references can be given.—Address, stating full particulars, to K. W. 50, Lombard-street, London, E.C.

METROPOLITAN CATTLE MARKET.—The Markets Committee of the Corporation of London will meet at Guildhall on FRIDAY, the 18th of NOVEMBER next, at ONE o'clock precisely, to receive PROPOSALS for LEASES for 21 years of TWO HOUSES, or Taverns, known as the Queen's Arms and the City Arms, at the Metropolitan Cattle Market, Copenhagen-fields, Islington. The parties taking the Taverns will have the option of renting a piece of meadow land at the rear of and adjoining the Taverns. Plans of the property to be seen, and further particulars obtained, upon application at the Architect's Office, Guildhall.

FERDINAND BRAND, Comptroller.
Guildhall, October 27th, 1864.

WESTON-SUPER-MARE, Somerset.—BUILDING LAND, Freehold, for SALE.—The only land having direct frontage to the sea now remaining unbuilt on in the town. Space for 100 houses, in streets, terraces, and squares; forming an entirely new part of the town. Splendid site for a grand hotel (finished). The whole lies on the sea shore.—Apply to Mr. B. G. PHILLIPS, Weston-super-Mare.

SUNBURY COURT ESTATE.—This Estate is now TO LET on BUILDING LEASES for the erection of detached residences of a superior class. The property is situate within a mile of the Sunbury Station, and within three-quarters of a mile of the Hampton-court Station of the London and South-Western Railway.—For particulars, apply to Mr. R. R. ARNTZ, Architect and Surveyor, No. 4, Cannon-row, Westminster, S.W.

EXHIBITION ROOMS.—TO BE LET, until the end of FEBRUARY, the GALLERY of the SOCIETY of BRITISH ARTISTS, consisting of five large rooms.—Inquire on the Premises. THOS. ROBERTS, Secretary.
Suffolk-street, Pall-mall.

BARKING, ESSEX.—TO BE LET, for the ERECTION of VILLA RESIDENCES, 45 Acres of LAND, with frontage to the main road close to the Station. Twenty minutes' rail from Fenchurch-street. Annual tenants, 7l. Land to be enclosed free of charge. Plans prepared. For plans and particulars, apply to Mr. DENSHAM, Architect, 12, Doughty-street, Mecklenburgh-square, and Post Hall, Essex.

BUILDING SITE REQUIRED.—TO PURCHASE, or LONG LEASE, a PLOT of LAND, containing about 3,000 superficial feet, within one mile north, south-east, or west of Lincoln's-inn-fields.—Particulars to be sent to Messrs. WILLIAM MAYHEW & CALDER, Architects, 8, Charing-cross, S.W.

GIPSY HILL, NORWOOD.—Valuable PLOT of FREEHOLD BUILDING LAND, comprising about 1½ acres, with frontages to two roads. TO BE LET or SOLD in lots, 100l. per annum on a Building Lease; or could be divided, if required. For particulars, apply to Mr. DURRELL, Auctioneer and Land Agent, 1, Walbrook, Mansion House.

TO BRICKMAKERS and OTHERS.—TO BE LET, on Lease, to Farm, at a surface rent and at a moderate royalty, for Brickmaking, about 26 Acres of first-rate EARTH, which is pronounced to contain 7 beds. Near the railway station on the Great Western Railway, and about a quarter of a mile from Botwell Wharf, Hayes, Middlesex.—Order to view and particulars on application to Messrs. E. & C. NEWMAN, Auctioneers, Uxbridge.

FREEHOLD BUILDING LAND, within ten minutes' walk of the Bank of England, FOR SALE. A very large area, suitable for shops and warehouses.—Address, MERCATOR, Messrs. Watell w. Brightman-lane, E.C.

TO BE LET, by the Bridge House Estates Committee, a HOUSE, No. 2, Chatham-place, Blackfriars, in the City of London. Further particulars may be obtained upon application at the Architect's Office, Guildhall.

FERDINAND BRAND, Comptroller.

TO BUILDERS and BRICKMAKERS.—TO BE LET, a BRICKFIELD, containing 5 acres, near the water side and a railway-station.—Address, A. B. Post-office, Grays, Essex.

SPACIOUS MANUFACTURING PREMISES TO BE LET on Lease, 2½ miles from the City. Well adapted for a large BUSINESS. Frontage nearly 300 feet, and depth about 150 feet. The Great Surrey Canal flowing direct to the Thames, is but a quarter of a mile distant, and the Brighton Line of Railway runs over a portion of the Property. Covered space about 12,000 square feet. Convertible Plant in the Premises, which may be taken at a fair valuation. Further particulars of Messrs. DEBENHAM & TEWSON, 80, Cheapside.

TO CONNOISSEURS.—Ancient STAINED-GLASS WINDOWS.—FOR SALE, by Private Contract, a Pair of very rare and extremely beautiful Examples of the times of "Stephanus Rex," A.D. 1135, and "Henricus Tertius," A.D. 1216, uniform in size, viz. 5 feet 6 inches high and 2 feet 7 inches wide. Perfect gems of art of the period, of undoubted originality, full of subject, and in exceptional preservation.—For full particulars and to view, apply to Mr. EDWARD HOOPER, Estate and House Agent, 12, Old Bond-street, Bath.

LEAD GLAZING for CHURCHES and other BUILDINGS, Plain Quarries, Geometrical Patterns, or Fret Work. Builders and the Trade are supplied with every description of Lead Lights and Window Lead, on the shortest notice and lowest terms, by F. ODELL, Plain and Ornamental Lead Glazier to the Trade, 8, Bath street, City-road, E.C. Extra strong Lead for Churches &c. Estimates forwarded on receipt of particulars.

THE PATENT CRYSTAL WINDOW BARS, adapted for domestic windows, shop fronts, conservatories, skylights, verandahs, exhibition and counter cases, aquariums, fern cases, &c. &c. combining perfect transmission of light, durability against rust or decay, and economy in the facility with which they are kept clean. PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS, AS WELL AS BY THE PRINCIPAL NOBILITY, GENTRY, AND HUNTING ESTABLISHMENTS IN THE KINGDOM. IN USE AT HER MAJESTY'S STABLES, ALDERSHOTT.

The above, and every Fitting appertaining to the STABLE and HARNESS-ROOM, arranged for inspection in full-sized Stalls, Loose Boxes, &c. (a portion of COTTAM & CO.'s extensive Warerooms being devoted entirely to that purpose).

ILLUSTRATED DESCRIPTIVE PRICE CATALOGUES free, on application to

COTTAM and COMPY. ENGINEERS and IRONFOUNDERS, 2, WINSLEY STREET, OXFORD STREET, W.

COTTAM & CO.'S only address in London, is 2, WINSLEY STREET, W.

N.B.—Winsley Street is the Street opposite the Pantheon.

VENTILATION.—OVERCROWDING.—Boyle's System of Natural Ventilation ensures *more* healthy condition of atmosphere in overcrowded than is usually present in thinly-inhabited or empty places. The heat arising from the state of overcrowding is the motive power which works this system with infallible regularity and effect. The smaller, closer, hotter, and more overcrowded a place is, the easier and better can it be ventilated on this system. It is applicable to all places alike, Cottages, Mansions, Public Halls and Buildings, Churches, Hospitals, Factories, Work-rooms, Stables, Cow-houses, Conservatories, and even Mines and Ships. Let no one form a hasty conclusion from the seeming extravagance of this statement. It is a far wiser plan to examine first and conclude afterwards.

"*In one instance under our own eye Mr. Boyle has operated very successfully.*"—Article, "Air in the Corners," *Builder*, 15th October, 1864.

THOS. BOYLE, No. 23, Little St. Andrew-street, Upper St. Martin's-lane, London. Agents, Messrs. COMYN, CHING, & CO., at same address.

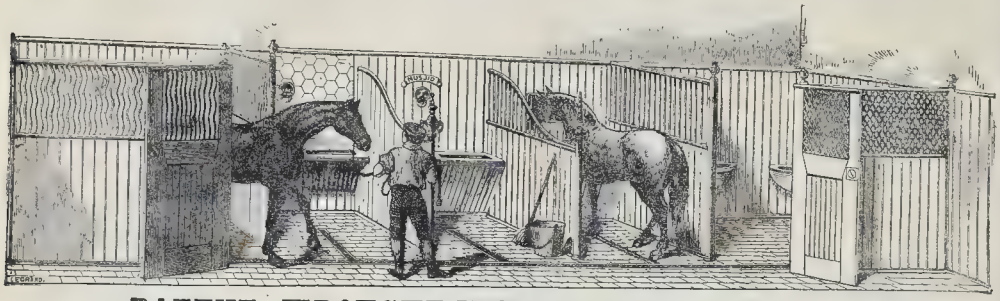
ST. PANCRAS IRON WORK COMPANY,



OLD SAINT PANCRAS ROAD, LONDON, N.W.

APPROVAL OF THE ROYAL VETERINARY COLLEGE.

THE MEDALS OF ENGLAND AND FRANCE,

And the Medals and High Recommendation of the Royal Agricultural Societies of England and Ireland.

SECURED BY EIGHT SEPARATE PATENTS. LATEST, 1863.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, with RACK & WATER-TROUGH,

The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

THE HALTER BALL, ATTACHED BY A NEW IMPROVEMENT, WORKS NOISELESSLY, AND ALMOST WITHOUT FRICTION.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible,—advantages peculiarly their own.

THE PATENT HARNESS FITTINGS

Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

ILLUSTRATED LISTS ON APPLICATION.——INSPECTION OF SHOW-ROOM REQUESTED.

FIRE-PROOF CONSTRUCTION.—

FOX & BARRETT'S PATENT.

This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.

The system combines ECONOMY with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.

The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring boards, or of cement, asphalte, tiles, slate, or other material.

Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great desideratum of fire-proof construction, even for ordinary dwelling-houses and domestic buildings, within the reach of every one.

Further information may be obtained of the Proprietor of the Patent,

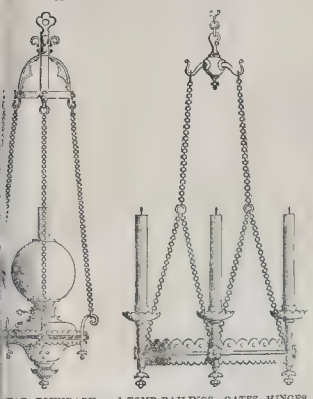
MR. BARRETT,

12, YORK BUILDINGS, ADELPHI

NO SHUTTER BARS.

JENNINGS'S SHOP-SHUTTER SHOE,

SHOP SHUTTERS are SHOD and SECURED by the above, at HALF THE COST OF THE UNSIGHTLY AND DESTRUCTIVE SHUTTER BAR. Shops referred to in every public street in London.



When ordering the above, send FINISHED THICKNESS of Shutters, and the way they go up.

Sold by all Ironmongers, and the Inventor,

GEORGE JENNINGS,

Engineering Depot, Palace Wharf, Stangate, Lambeth, S.

The Trade supplied on liberal terms.

JOHN GREENWOOD, PATENTEE,

"By Royal Letters Patent."

"Indicator" Dial, 2½ in. diameter.

ELECTRIC BELLS FOR DOMESTIC USE.

BREGUET'S PATENT INDICATOR SYSTEM, with a Dial which shows when the Bell is ringing, the same as in use at the Grand Hotel, Boulevard des Capucines, Jockey Club, &c. Paris.

The superiority of Electric Bells is already settled in America and in France. For all modern works at Paris they have as effectually superseded the old crank and pull plan as, for travelling, the railway has superseded the antiquated stage-coach.

ADAMS & SON have much pleasure in stating that they have made arrangements with Messrs. Breguet, of Paris, to become their sole Agents for the sale and fixing of their Patented Apparatus upon the "indicator system," which has great advantages over all others, and is especially adapted for hotels, public buildings, and other large establishments. The details of this ingenious instrument, together with a description of the various apparatus in use for Electric Bells, may be had upon application, or by post.

MUSGRAVE'S PATENT HARMLESS LOOSE BOXES. MUSGRAVE'S PATENT IRON COW-STALLS AND PIGGERIES.

Architects who have not seen these Fittings are requested to write for Engravings, as they are unlike those of any other maker, and were awarded, on account of the work of the Fittings, the Prize Medal at the International Exhibition of 1862; and MUSGRAVE, BROTHERS, are now fitting several very large establishments and Government Dockyards, noted for keeping only what is the best of its kind. Particulars of these, as well as of MUSGRAVE'S PATENT SLOW-COMBUSTION STOVE, will be forwarded on application to

MUSGRAVE, BROTHERS, ANN STREET IRON WORKS, BELFAST.

THE DENNETT ARCH.

Allowed to be the cheapest fireproof construction known, and used with the greatest success for the last ten years in the Midland Counties, and has been adopted by G. G. Scott, Esq., for the New Foreign Office, used in any form of arch, groin, or dome, turned to any height, width, or height, forming a perfect floor and ceiling in one piece, from 2½ inches in thickness to any required thickness.

Address to the Patentees, Bridge-street, Nottingham.

A. & R. DENNETT & CO. NOTTINGHAM.

TESTIMONIAL. "I have made use of Messrs. Dennett & Co.'s material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme convenience of application. I have made use of it in a variety of ways, which I should have found it difficult to introduce any other kind of material, and it has the advantage, that the arches constructed of it are so entirely void one mass but they cover the space like a compact shed or inverted basin, and are, consequently, almost wholly free from lateral pressure.

"GEO. GILBERT SCOTT, 20, Spring Gardens, London."

THE PATENT UNIVERSAL CHIMNEY HEAD

The Chimney Head has been designed for the Prevention of Smoky Chimneys and Down Draughts. The Louvre or side apertures are so placed as to guide the wind upwards as it strikes the Head from any quarter, thus creating a strong current of air at the top of the smoke flue, through the Cap. The same apertures are also adapted to the wind overall sides or cause of the striking downwards from above, and this greatly diminish the danger of its passing down the chimney.

Price 9 Inches ..... 20s.
Ditto, 12 Inches ..... 32s.
Price 1 Guinea Iron ..... 42s.
Ditto, Kitchen ..... 15s.

A Liberal Allowance to the Trade.

Manufactured solely by

BENHAM & FROUD,

GENERAL METAL WORKERS.

40, 41, and 42, Charles street, Charing cross, London, W.C.

An Illustrated Price List may be obtained free on application, or forwarded by Post in Town and Country.

SMOKY CHIMNEYS,

S. DEACON

Respectfully invites the attention of Architects Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, many existing chimneys where other caps have been of no avail.

The advantages attending this Cap are—it can be thoroughly cleaned by the sweeps as when the chimney is swept, the brush being free to pass through the Cap without the liability of misplacing it; an increased up current, and the impossibility of a down one.

Prospectus, with testimonials, forwarded on receipt of Postage-stamp, by

FRANCIS HAMMOND'S VENTILATING GLOBE LIGHT,

combines in a most desirable method of lighting, with economy, simple, and efficient ventilation.

The advantages derived are these:—

A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION.

A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR.

AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.

A GLOBE LIGHT will consume about 7 feet of gas per hour, giving as much light as an ordinary three-light chandelier, with a consumption of 12 feet per hour.

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

DESACHY'S FIBROUS PLASTER.

GEORGE JACKSON & SONS,
HAVING BECOME THE PROPRIETORS OF THE PATENT RIGHTS IN
DESACHY'S FIBROUS PLASTER,
Beg to call the attention of Architects to its Capabilities.

It is adapted for the speedy and economical production of any coffered or circular work, waggon-headed ceilings (all bracketing being avoided, as it is fixed to the joists direct), fluted and plain columns, panelled dados, all kinds of diaper, &c.; for the linings of walls and ceilings, and for all purposes of ornamental plaster.

The advantages are great. It is of great lightness and of excellent quality; it is not inflammable, and is ready to be painted immediately after it is made; it has been used (under the direction of Owen Jones, esq.) for the ceiling of St. James's Hall; at Messrs. Osler's, Oxford-street; Mr. Hancock's, New Bond street; the Crystal Palace Bazaar; the Home for the Aged, South Lambeth; and at various other Works.

SPECIMENS CAN BE SEEN AT 49, RATHBONE PLACE.

POLONCEAU and SEYSSEL ASPHALTE.

ESTABLISHED  1838

For covering Flat Roofs, Paving and Flooring of every description, especially in places subject to damp and vermin. This Asphalte is now extensively used for paving Stables (as it will not, the absence of joints preventing the generation of ammonia). For Estimates and Prices, &c. &c. apply to JOHN PILKINGTON, 15, Fish street-hill, London, E.C.

Country Builders supplied with Asphalte in Bulk for covering Footings, Bare Floors, &c. with instructions to lay it down.

DENT'S TURRET CLOCKS.

—The attention of Public Bodies, Gentlemen, and others, is respectfully requested to the Improvements made in the Construction of CLOCKS, suitable for STABLES, CHURCHES, and other Large Buildings, by the late E. J. DENT and F. DENT, Clock and Chronometer Makers to the Queen and Prince Consort, and Makers of the GREAT CLOCK for the HOUSES of PARLIAMENT, &c. Turret Clocks, with Compensation Pendulum, adjusted for variations of temperature, to work the hands of dials of any size, from 1 foot to 20 feet diameter.

E. DENT & CO. 61, STRAND (adjoining Coutts's Bank); and 34 and 35, ROYAL EXCHANGE, LONDON.

GUTTA-PERCHA MILL-BANDS.

—The Gutta Percha Company beg to state that the increasing demand for the Gutta-Percha Strapping for Driving-bands, Lathestraps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractility and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Bosses, Union-joints, Flasks, Bottles, Bowls, Toilet-trays, Curtain-rings, Galvanic Batteries, Talbotype Trays, &c. &c. manufactured by the Gutta Percha Company, and sold by their Wholesale Dealers in town and country

VOL. XXII.—No. 1136.

The Cathedral of Milan.

ORIO, an old historian of the city of Milan, chronicles the event of the founding, in 1386, of its celebrated cathedral in the following words: "In this year, on the 13th of June, was most happily commenced the marvellous structure of the great temple called the *Duomo*, which most stupendous and renowned church may be affirmed to be chief among all others in the world." And surely the aim here recorded has been worthily pursued within the limits and degree existent. We feel it in the inexpressible emotion awakened by the first sight of this marble sanctuary; we feel it still more after becoming familiar with its aspects in all their grand variety, with the effects of morn and evening, of sunlight and moonlight, in its solemn courts, or on the gleaming surfaces of its statue-peopled exterior; and we are glad to find that the newly-constituted Government has felt, and shown its readiness to act upon, the responsibility involved in the possession of the Lombardic capital, with regard to this edifice. Under the sceptre of the Italian king, the works, only at intervals, though sometimes for long intervals, suspended since the great undertaking was commenced in the fourteenth century, have been effectively, and we believe intelligently, prosecuted.

In our account of a journey in Northern Italy, given in our last volume under the title "Going Along," we alluded briefly to this well-known remarkable building. Many of our readers, however, will doubtless be glad to be reminded more minutely of its history.

The founder of this great church was on the point (singular coincidence) of assuming the crown and title of "King of Italy," when he was cut off by death in the midst of unexampled successes, and at the acme of the greatness to which his dynasty had yet attained. Gian Galeazzo Visconti had raised the revenues of his dukedom to the amount of 1,200,000 florins; and the provinces and towns under his sway were so numerous that, among the pomps of his funeral, 246 mounted retainers were required to display their standards! It has been supposed —we believe on no other ground than conjecture—that he was urged to the founding of this cathedral by the pangs of remorse for the murder of his uncle, Barnabo Visconti, a ferocious tyrant whom he deposed, by a vigorous *coup d'état*, threw into prison, and is said to have caused to die by poison; but it seems far more inconsistent with his character to assume, as do the chroniclers of his city, that an insatiable ambition was the less worthy, whilst possibly an impulse of pious feeling was the purer, motive that urged him: nor is it likely that the conscience of a Visconti could have been much troubled by a *single* murder, whose victim was the oppressor both of his relatives and subjects.

Striking indeed is the contrast between the light of genius that shines from this glorious temple and the moral darkness of the age in which it rose to incipient reality, so triumphant a testimony to the harmonious accord of art and religion. The Visconti who succeeded to Gian Galeazzo was the juvenile Nero who used to hunt his subjects to death with bull-dogs, by way of amusement, in this city's streets, and who delighted to see victims, whether innocent or guilty, suspected or harmless, torn to pieces in his presence by those pet animals; till at last assassination rid the world of this monster before he had completed his twenty-fourth year. Shortly after the beginning of the works for the church, the jubilee, or holy year, was published by Boniface IX.; and that pope complied with the Visconti's request, by granting the indulgences promised for all pilgrims to Rome, *without* the condition of that journey, to all the subjects of the Milanese States who should subscribe two-thirds the amount requisite for the pilgrimage towards the cost of the *Duomo*, with deduction (so carefully did the pontiff keep in view the interests of Rome's *curia*) of one-third that offering for the papal treasury. It appears that the idea obtained, favoured by the gross ignorance of the times, that the *other* usual conditions of the indulgence — penance, the sacrament, the state of grace, &c.—were *not* required in the bull of Pope Boniface; and Verri ("Storia di Milano") supposes that the immense pressure of multitudes with their contributions for obtaining this indulgence was mainly owing to the strange delusion as to what the Papal promises really conveyed and were conditioned by! The Bull may have been grossly misunderstood, morality in no way forwarded by it; but the sacred undertaking prospered thereby; the money was not thrown away. This greatest edifice entirely of marble ever yet raised, stands on the site of a cathedral built in the year 836; and, up to the present day, has absorbed costs to the amount of 544 million francs, without reckoning the intrinsic value of the marble, from the quarries on the Lago Maggiore, all bestowed gratuitously by the Visconti founder. According to the description on sale at present, and offered by guides within the building, *more* than 7,000 statues adorn its exterior and interior, whilst about 3,000 are still wanting to complete the magnificent project of this sculpture-decoration.* Among those recently erected, forty have been the addition made under the present Government; and we counted thirty-nine along the *embouchures* of lateral windows, all evidently new, as shown by the fresh purity of the marble, and in many instances works of high merit. Angels, prophets, patriarchs, apostles, martyrs, prelates, virgin saints,—the leading purpose of this majestic grouping may be said to be the combination of Sacred History, the Old and New Testament, with the entire hagiography of the Church, in one imposing aggregate. Many are unequal,—many placed quite beyond the reach of the criticizing eye; but the power and expression observable in a great number entitle them to all praise; and it is the wondrous harmony of the artistic whole that produces the effect so thrilling, so entrancing.

> A fit abode, wherein appear enshrined
> Our hopes of immortality—

might have been said by Byron of *this* far more truly than of Rome's great basilica. On its summit are 136 pinnacles, each supporting twenty-five statues of angels or saints; and above the single tower, at the juncture of the transepts, rises the spire, surmounted by the colossal figure, in gilt bronze, of the Blessed Virgin. The last added, and in its design, rich mouldings, and open-work, one of the most beautiful among those marvellous pinnacles (we might call them, indeed, subordinate spires), is by the architect Pestagalli, who held the post of director to the works for the *Duomo* from 1813 to 1853, the year of his decease; about half a million francs being the cost of this addition to the splendid pile. We must leave it to the poetry of Wordsworth, for no other language save the truly poetic would answer to convey the impression received when one stands on the summit amidst that marble multitude; whilst draperies and wings, upturned countenances, and glorified heads, are all radiant in the first beams of morning (an effect we secured the enjoyment of), the sense of a spiritual *presence*—that feeling, indeed, excited by all sculpture of the highest order—will here possess the mind as intensely, we believe, as before any other art-creations upon earth. Up to this day the question remains undecided as to who was the actual creator of this celebrated building. Did the idea originate in the Teutonic or the Italian mind? Certain it is that a German, whose name is Italianized into Enrico Gamodia, or Zamodia, was engaged in it so early as 1391, together with eight Italian architects and one named Giovanni Annes, or Annex, of Fribourg. The published list of all the architects, whether regularly appointed or merely consulted for the carrying on of these works, includes no fewer than 182, among which the only foreigners, besides the two above mentioned, are two Frenchmen, one Fleming, and two Germans, Pollack, father and son, of Vienna, appointed 1803-6. During the last years of the fifteenth century Bramante was engaged as chief architect; during the sixteenth century we find such distinguished successors at that post as Giacomo Della Porta, Giulio Romano, Alessi, and Pellegrini. In 1490 the comparatively small cupola was erected by Antonio Omodeo; in 1760, the spire that crowns it by Francisco Croce. In 1806 was completed the façade by two architects, Zanoja and Agosto, who carried out a design, their joint production, without destroying the works of their predecessors in this part. Pellegrini (1567-86) won unfortunate distinction by striking into a new walk, and adopting a style totally adverse to that predominant throughout the grand structure, so far as he had time to carry out, in the façade, his Renaissance purpose,—happily limited, as we actually see it, to the details of portals and windows. From his time the works were but little advanced, and the whole undertaking languished till stimulated into new vigour by the stirring spirit of the first Napoleon (1805, the date of his decree for the ultimation). Again, from 1853 till 1860, the post of directing architect was vacant; but at the commencement of that last year was appointed the present, Giuseppe Vandoni; in the preceding interval some works of construction and repair having been still in progress, under the superintendance of Count Nava, member of the "Administration," or Board, now consisting of eight persons, under the presidentship of Count Renuto Borromeo, responsible for all that concerns the material fabric of the Duomo. Among works whose completion is yet to be expected (and, we understand, in progress), is the coloured glass for the windows, four of which yet want that detail. The ancient glass-painting of Milan is celebrated; and the suffusing radiance that emanates from these windows, at the hours particularly of sunrise and sunset, add a gorgeous yet subdued solemnity to the effect that overwhelms with awe when we pass the threshold of this great minster. Most ancient here is the tinted glass of the year 1400, by artists from Venice and Normandy; next in order of time are the windows of 1438, painted by Milanese and French practitioners; next those of 1570, date at which Giovanni de' Bartoli, a Milanese, established a factory for the preparing of coloured glass, ex-

* The great *Encyclopædia*, whose publication has been going on for some time at Turin, makes the number of these statues, as they stood about ten years ago (or more), 2,602, of which 1,923 were then on the exterior.

pressly to supply this church. Not long subsequently, or in the following century, it seems, this art fell into neglect and oblivion, till in our own times revived by an ingenious family named Bertini, to one of whom, Giovanni, the "Administration" has had a tablet erected, near the finest specimens of his own performance, the choir-windows, with an epigraph, dated 1849, ascribing to him the merit of restoring and perfecting a long-interrupted art-practice. Those three great windows of the choir (the tinted glass of the highest parts alone ancient, the rest by the Bertini), represent the entire history of the Old and New Testaments, besides many scenes from the Apocalypse, figures of prophets and apostles; the designs very unequal, some (as it struck us)* not above mediocrity, the groups crowded, and forms heavy; but we forget to criticize in admiration before the resplendent effect of their rainbow-colours, the fine harmony between this decoration and the structure around.

The five quadrate windows (in form so incongruous) in the western end wall, corresponding to the portals, are other examples of modern work by the same family, with largely-treated subjects, each occupying the entire field; the "Assumption of the Virgin" (central), "St. Carlo Borromeo dispensing Alms," "St. Michael overcoming the Demon," "The Election of St. Ambrose to the Papacy" (not by Rome), to this see, and "St. Thekla (a patron saint of the city) exposed to Lions in the Amphitheatre,"—all treated with ability, though not all equally good, and in colouring alike beautiful. Among the several sculptors engaged for the immense series erected within and without, and still in process of erection, we find no names that are not Italian; to one, Brambilla, who dedicated his labours exclusively to this object for forty years, is placed a tablet recording those services, with the date 1599. A pleasing relief, "The Birth of the Virgin," by Tantardini, placed on an altar-front in the present year, affords a guarantee of progress in this department, under the actually responsible parties.

As to the question of the original architect, a Milanese chiefly, of local literary repute, is quoted by Varri (Storia") in a passage where the claim is at once ceded to foreign genius, "artists summoned from Germany," who (such the reverend critic's judgment) "left us in the great structure of our cathedral a monument of barbaric opulence rather than of good taste!" But Ignazio Cantu (brother to the great historian), who has written an excellent historico-antiquarian Guide to Milan, decides in the opposite sense, naming *four* native architects of the period, one of whom he concludes to have been the originator first engaged for this great undertaking by the Viscontis; and in this the printed list, given in the manual above noticed, agrees with the writer of the Guide, placing first in order, under date 1387, two of those he names,—Marco da Campione and Simone di Orsenigo. That century, the age of Dante and Giotto, witnessed the triumphs of Italian genius in every walk; and though among the renowned minsters then rising to completeness in that country, none strictly analogous with that of Milan can be pointed out; yet when we remember what and how varied are the elements of grandeur and beauty in such cathedrals as those of Florence (founded 1298), of Orvieto and Siena (both in 1290), of S. Petronio at Bologna (1390), we may be the more ready to regard the cathedral of Milan as another monument to the supremacy of art and science in this classic land.*

This celebrated archiepiscopal see has been left vacant since 1859, because the Pope will not come to terms with the constitutional Government for appointing any nominee to this or other of the several Italian sees now in the same condition. Originally matters stood on a very different footing in the Church of St. Ambrose: the people elected *immediately* to this important pastoral post; subsequently, the clergy, but still with deference to the popular approval. These rights being postponed, the emperors assumed the prerogative of appointing, with the much-disputed investiture, to all sees within their states or under their protection. Later the same privilege with regard to Milan was secured for the papacy by the efforts of Urban IV.; but eventually, Joseph II. (in 1783) reassumed that right for the Imperial Crown, though it has since been modified in exercise by the deference to Rome for approval. Shortly before the war of '59, the Emperor had appointed a successor to the late archbishop of this see. The papal sanction ensued; but, as the King of Italy could not accept the nominee of a hostile Government now expelled from these provinces, and the Pope refuses his approval for any other, the vacancy still continues.

* Measurements of Milan Cathedral in *mètres*:—Length to extremity of choir, 131·1; width, including nave and four aisles, 67·781; width of transepts, with chapels at extremities, 87·8025; height of nave to surface of vaulting, 49·82, height to summit of statue on spire, 110.

DISCOLOURATION AND DECAY OF STONE IN BUILDINGS.

We could wish that the observations in our article on "London Architecture and the City," and the reference in articles subsequent, as well as antecedent,—as in our volume for 1862, wherein may be found descriptions of different smoke-consuming grates in the International Exhibition, contrivances respecting which evidence would be desirable, had drawn the serious attention of our readers to the circumstance of the immense impediments that there are to the production of art in buildings, and the perception and appreciation of the art when produced, comprised in the existence of the smoke-nuisance. It may be that the deposition of soot, and the blackening, and the obscuration of the atmospheric medium through which delicate forms have to be viewed, are not to be regarded exclusively as the causes of a production which, as we lately said, is small in proportion to the number of buildings erected, or of an appreciation which is manifested by the tasteless demand for mere members of architecture, or without regard to the manner of their use. There are towns in England where the architectural movement seems to us to possess a higher art-character than is to be credited to the movement in London, at least excepting one quarter of the City of which we have spoken; and in those towns, the quantity of carbon constantly in the atmosphere is greater than that in London. The humidity is also greater; but possibly the stone there, which is much harder than the Bath and Caen stones that have been so largely used in the metropolis, may be less rapidly discoloured by an equal quantity of dirt. However this may be, the deposition, blackening, and obscuration by smoke, are enough to make the buildings in general, in those towns, repulsive; and it must be due to the larger mass of a warehouse-building as compared with that of the front of three windows, to real taste, or to ostentation as a substitute, — and not forgetting the intrinsic merit of the work as designed,—that the effect produced is to a considerable extent one of good architecture, and that it is not entirely unappreciated by the people of those towns. Whether in London, or in the manufacturing towns, it is however to be admitted that the nuisance causes a deduction from realized effect of architecture, which is very considerable in extent and amount, and that it would be easy to show that all our shortcomings in art-work in buildings, and the almost general lack of perception and appreciation of the art proper, may have their origin in the smoke-nuisance alone.

Still, we do not see that either the question of the diminution of the nuisance, or one of the discovery or adoption of some means of preventing or removing the discolouration of buildings, occupies much of the attention of architects. Yet, the better appreciation of the *art* of architecture by the public should directly concern our profession; and so long as the art-work and effects which architects produce, are not lasting as the structures of former times, they can hardly come before the public with a clear conscience in advising the expenditure of money upon decoration. Moreover, the subject of the selection of stone, and of the preservation of the material from decay, remains in a very unsatisfactory state; and it is impossible to avoid here referring to the loss of the services of Mr. C. H. Smith, a man whose information, and the results of whose practical experience, were to be always valued, even by those who differed with him. Of noticeable results of any attention to either subject, the preservation of the original appearance, or that of the material itself, there are none, unless they may be said to be comprised in a partial abandonment of the material in favour of coloured brickwork and terra-cotta. We have shown, however, that in the case of one of these vehicles of decoration, the brickwork, the designed effect suffers by the encrustation and discolouration, scarcely, if at all, less than in the case of stone. As regards terra-cotta, we would at present reserve further opinion than we have heretofore expressed. Stone, of light colour, has usually been considered the material the most serviceable for architectural effect: it is still so in Paris; and in other Continental towns where it can be obtained, and where the decay is by no means so rapid as in London, the freedom from encrustation and discolouration, and the purity and clearness of the atmosphere, allow of such effect of architecture as cannot be imagined by one who has not seen the buildings.

It would seem that the stone which is least subject to disintegration or exfoliation, is not necessarily that which preserves the cleanest appearance. A clean appearance may be the result of decay, in a soft and disintegrating stone; or, in certain other stones, as Portland stone, it may be produced by simple washing. The washing by the fire-engine to which we have so often called attention recommendingly, and last of all in one of our articles above spoken of, has been proved to be effectual in the case of at least three or four of the most important buildings of the City. A paragraph from the *Standard* of March 2nd, 1862, now before us, says:—

"Within the last few days the *façade* of the Mansion House has undergone a complete washing, which has brought out all the characteristic points of the architecture in a striking light; and the process has been as novel as effective. For three hours, on two mornings, between five and eight o'clock, two of the engines belonging to Shand & Mason's steam fire-engine establishment played upon the front of the building alternately, until at length it became almost as white as marble."

The same journal records the application of a similar process to the front of Mercers' Hall, in Cheapside. The result in the case of the Mansion House, particularly noted by us at the time, as well as on a different occasion some years previously, when the engine was worked by hand, was precisely as described by the *Standard*; as it was also in the case of the Royal Exchange, in 1862, cleansed in the same manner as the Mansion House, and as referred to in our former article. St. Paul's Cathedral is washed in some parts most effectually by the rain, only so that the blackness of the parts not washed makes the whole appear more repulsive, perhaps, than it would otherwise. We may, however, conclude that with proper attention, many of the buildings of London might be maintained in their original architectural effect, of which scarcely any impression is at present to be realised, and by the aid of a contrivance always ready, and of the most economical application. But, these buildings, all, would seem to be structures wherein the stone used was hard, and in which the soot had not been absorbed, as it is liable to be by a soft stone, as Bath, even the best.

The common designation, "Bath stone," includes, we need hardly say, numerous varieties. Notwithstanding the determination by the late Dean Buckland, against the use of Bath stone in the works of Westminster Abbey, and the bad repute into which all such stone got by numerous failures, there appears to be such a thing as Bath stone capable of standing well in the metropolis. Whether, having made selection of a good quarry, the architect can always ensure that the supply shall be from the best bed, is another matter. Mr. Smith maintained that in any case of stone required for such a building as the Houses of Parliament, the only safe course was for the architect to have a competent and trustworthy representative to see to the getting out and marking of the blocks at the quarry itself. Had his advice been taken, and had the very moderate remuneration he needed been allowed him, the present decay in the material of the Houses of Parliament, and the unsightly patches of the experimental applications with a view to remedying the decay, would not have been as now apparent. But, supposing, in a London building, a description of Bath stone to be used of the unobjectionable character in the view of the durability, this very stone seems to be so susceptible to blackening, that it must become in ten or a dozen years very unsightly; and the discolouration of such stone, we apprehend, is not to be washed away.

Going up the Edgeware-road, at the corner of one of the streets leading west, is a building which was erected some few years ago for the branch of the London and County Bank. When new it was a particularly effective work, of Palladian or Venetian Italian style, and dependent in great measure for its effect, as all good architecture is, upon well-studied and tastefully-practised detail, including mouldings. The elevation presents one lofty story only: so that the work is one challenging examination from a near point of view. In such a work, a

uarter of an inch, or even an eighth of an ch, more or less height or projection in a oulding, could not have been deemed unim-ortant. At least, if the difference be of no ioment, we have been greatly overrating the erit of the design. The material of the whole ont is Corsham Down stone, with the exception f the cornice, which is the Combe Down stone, onsidered to be harder than the other. The aterial remained in excellent preservation, ructurally speaking, up to some few weeks ince; and the circumstance has been attributed, s in similar cases, and not quite conclusively, o the stone having been well "seasoned" t the quarry, or that the blocks had lain ome time after they were quarried, before eing sent to London. But the ten years, r whatever may have been the short lifetime f the building, were sufficient for the London moke to produce the usual result. The reader ill mark what ensues. The directors, or who-ver have the authority, we suppose remark that he building has no longer prominence over djacent buildings, as it originally had from s architectural character. There had been, of ourse, a commercial object in the production of he art, and excusably so. So, the architect is noved to set to work Mr. Fish, the builder, and is masons, with various scarifying tools, and nallets and chisels, which the hardness of the tone rendered necessary, to take off the crust f soot. But as the penetration was too deep o be got rid of by washing, a thickness of the ighth of an inch, at least, was scraped or hacked way. It was hard work, and according to an ntelligent man engaged upon the business, the tone, in place of continuing as found, in excel-ent preservation, was in all probability, made erishable by loss of the protecting crust. In nother ten years perhaps, the building will gain be thought to need cleansing. The value f the work of architecture, after two or three uch operations may be supposed.

The Army and Navy Club, in Pall-mall, has ately undergone extensive reparation, and has erhaps more than once: and a year ago, the ornice had to be renewed in cement, the stone eing duly hacked to get the proper key; whilst he lions' heads were renewed, also in cement, nd seemingly a size larger than they were efore. Notwithstanding these operations, the uilding is black and patchy as before. In he front of the Carlton Club, in the same treet, and in the western portion of the front which was built last, the mouldings are crum-bling away in parts; so that the face of the tructure seems affected with some cutaneous isease. One of the balusters above the *corni-zione* has fallen. The balusters of the balcony of the smoking-room, in the garden-front, were half gone before the whole building was com-pleted. We wish to have it understood that in the present state of the question of the preserva-tion of stone, we attach no blame to architects.

It is scarcely a matter for surprise that such defects, noticed by the public and those who have to build, should help to extend that use of cement which is every year robing more of London in gloom. For, it is a fatal mistake to suppose that life is given to a brick building by covering it with Portland cement, and leaving it in the usual manner to blacken. To painting or colouring there are objections that we have often pointed out. There is nothing in any brick-built street so repulsive as the effect of Victoria-street, Westminster; and yet, the fronts there have a considerable number of what are ordi-narily regarded as decorative members of archi-tecture. The streets about Covent Garden, where the houses are just now receiving the addition of members similarly meant to be decorative, and which in this case are of such character that they would be effective if in stone, are taking the first step to their contribution to the gloom of London, as may be seen by looking at the cemented fronts which were executed five or six years since, as for instance those of the building at the corner of Bedford-street and Henrietta-street.

Even when stone, good stone, is used, it has sometimes not a satisfactory effect even in the few years that pass from the time of original erection to the general blackening. The use of brickwork as backing to ashlar masonry, is usually followed by an efflorescence on the face of the work. At least that is one explanation offered of the appearance which has been noticed in most of the new buildings of London where the best material has been used. On the front of the Reform Club there was such appearance for very many years, that was most unsightly; but the edges of the efflorescence followed the lines of the mortar beds and joints. As Mr. Smith was in the habit of saying: there was "not a bad stone in that building:" yet the effect was at the time perhaps worse than that of newly applied Portland cement.

In the new building for the National Provincial Bank, at the corner of Bishopsgate-street and Threadneedle-street, and already mentioned by us, Mr. John Gibson, the architect, is adopting a novel arrangement of the ashlar-work and back-ing, chiefly to prevent the efflorescence, which he attributes to the contact of the stone-work with the brickwork. His front walls, including three-quarter columns, may be stated as about 5 ft. thick, of which the brickwork would be 1 ft. 10½ in. Between the brick and the stone is a cavity of 1 in. The connexion, or bond, between the two materials, is effected by means of 6-in. slate dovetailed cramps let into the stretcher-stones, and into stone templates built with the brickwork, and by setting the inner ends of the header or bond stones on sets-off of the brickwork,—two courses of ½-in. slate slab and some plain tiles to make up the height of a course of bricks, being interposed: so that the stone never rests on the brickwork; and, through-out the front, one material never touches the other. Access for air to the 1-in. cavities will be provided by means of channels and inlets from space behind the skirting of the banking-room; and doubtless there will be outlets at the top. In each pier, in the brickwork, behind a column, there will be one of the flues; and the side of this flue, next the cavity, will be formed with Boyd's flue-plates; so that it is expected the heat passing through will promote draft. In building up the work, the cavity will be filled with boards on end, which can be drawn out as the work proceeds; and bits of mortar collected at the bottom of the cavity, will be cleaned out from apertures in the wall, temporarily left at its base. The archi-tect thus, calculating upon getting rid of the chance of efflorescence, we believe anticipates that he will escape retention of moisture on the ex-ternal face,—which moisture would serve to col-lect soot,—and that although his work may not always escape discolouration, it will have at the end of ten or a dozen years, a much more sightly appearance than the buildings in which the ashlar-work is backed with brick on the old system.

PROFESSOR DONALDSON ON THE PRO-GRESS OF ARCHITECTURE.*

I HAVE read with much pleasure and instruc-tion several of the papers written by members of the local societies, and a recent one by Mr. Frith, of Bristol, on the subject of "What should be the Aim of our Architecture at this Time?" contains much suggestive matter and just reflec-tions upon the present state of the principles of taste in our art. To one of his observations, however, I think objection may be taken, when he says that "we must learn to set aside all the decorative features of Italian architecture which do not spring from constructive requirements, such as attached columns and pilasters with all their ordinances—to accept no precedent which does not meet the critic's eye with a more satis-factory reason for its use than what we employ now in saying 'it is quite correct.'" I know not why Mr. Frith does not include under the same restriction Mediæval as well as Italian architecture. But I cannot add my adhesion to this law of *use* to be applied as the test of the proper adoption of many features in our art, for this would reduce it to a mere utilitarian plainness, and strike out from architectural composition many details that give playful-ness, grace, and variety of outline. The very attached columns and pilasters alluded to, may serve as buttresses and counterforts, and give stability and strength to a wall, breaking up its plainness and at the same time be pleasing features, like balustrades, pedestals, vases, and other accompaniments. If we apply this meagre puritanical rule of matter to art, what would Mediæval composition be, deprived of shafts, buttresses, canopies, pinnacles, introduced in its rich screen-work, whether of stone or wood? There must be a certain conventionalism in decorative art, and although it must borrow its leading features from some type that has *use* as its basis, yet the imaginative poetic mind of the artist must have full play and freedom of treat-ment, at the same time that it may be restrained by the sober rules laid down by Horace and Vitruvius. Fancy is a valuable gift; it is that action of the mind which at pleasure presents to itself impressions, the result of preconceived notions, or the forms, images, and representa-tions of things. It may be the result of educa-tion and taste, or of a refined innate sensibility for form and colour. Doubtless it may be very dangerous, when it degenerates into caprice, seeking to express a sudden ill-regulated affec-tion or predilection, disregarding wholly the strict rules of art, yielding to a rather licentious liberty; and yet it may be pleasing and attrac-tive by certain graceful combinations. Such were the styles of the Flamboyant and of Louis XIV. and XV., and many compositions at Rome, as the productions of Bernini and Borro-mini, with all their impurity; and we may quote in the English school Vanbrugh as a brilliant example of poetic grandeur in composition. These were epochs of violent instinct and sudden determination, uncontrollable sympathies and disregard of the material made to minister to the wildest flights, and the fresh excitement of sensuous gratification compensated for the in-herent defects of abrupt impulses. Their works, the result of ardent minds, have excited the wonder and admiration of succeeding times, as the efforts of a gifted race of artists. Human nature is so constituted, that such productions cannot pass unheeded; but, on the contrary, they must influence the feelings, however dis-cordant in many respects. In such instances Mr. Frith's observations apply with peculiar force, and are instructive to the practitioner in every period of life. Precedent has its weight as well as use; the mind, however, of the artist must have a certain range, if we are to expect the highest aspirations of genius, and to profit by its revelations.

I am pleased to observe that the success of this Institute has led our professional brethren in and near the principal provincial towns to form similar societies for the promotion of the art, and the maintenance of a high tone of pro-fessional practice and character, alike honour-able and advantageous to the employer and the employed. Liverpool, Manchester, Birmingham, Bristol, Glasgow, and other great centres of commercial and manufacturing industry, have their architectural meetings, read papers, and discuss questions of general interest, connected with architecture, archæology, and construction. This is the more necessary, as the material pro-sperity of our large towns, with the development of their municipal operations, necessitates the erection of town-halls, libraries, picture-galleries, courts of law, athenæums, hospitals, schools, churches, and other important edifices. These require an education of the highest order, as well as distinguished talents, so that the productions may be worthy of the appeal made to the taste and scientific requirements of the architect. These local associations have been obliged to relax the strict rule of membership observed by us, but generally they are guided by the same principles as ourselves. I have, however, ob-served with regret that some of the provincial societies, instead of strengthening their own position and that of the profession generally, by accepting in its integrity the scale of profes-sional charges adopted after the most pains-taking and deliberate investigation by this Institute, have sought to publish a distinct scale of their own, founded generally upon that of the Institute, without acknowledgment, and introducing modifications of purely a local na-ture. This is a sad mistake. The Table of the Institute has been accepted by legal men in the metropolis, and quoted in the courts as an authentic document drawn up by the heads of the profession, and as authoritative in settling such questions of professional usage, and as mutually binding between the employer and employed. The provincial Table, deprived of the sanction of the great central body, and resting only upon the authority of a limited circle of professional men, cannot have the same weight as the code of the Institute. The resolution of the Architectural Association on the subject is very judicious, as it very properly stated "that it would be most injurious to the profession to have two published lists of charges." . . .

In my address upon the opening of our last session, I alluded to the imperfect means and sources of instruction within the reach of the architectural student. This subject has been

* From the opening address at the meeting of the Royal Institute of British Architects, held Nov. 2nd or 7th. The whole document being before us, we give the follow-ing more widely interesting passages. We shall be truly glad, for the sake of the Institute, when we are again enabled to assist in making its proceedings properly known.

taken up by one at the head of our profession, whose own productions are evidences of refined taste, solid judgment, and extensive learning, and whose skill and experience are instanced in his numerous, and I may say numberless works, many of them the finest productions of modern times in Mediæval art. Mr. Scott, in a carefully written paper, has sketched out a view of the wants of the young architect, and the mode in which the deficiency should be supplied. A committee of the Institute was appointed, consisting not merely of professional men, but of others experienced in the subject, and capable of affording most valuable advice and suggestions; such as Mr. Beresford Hope, Professor Westmacott, R.A., E. W. Cooke, R.A., and Mr. Ruskin. We had several meetings of the most interesting character, and considered the best means of providing instruction; the discussions which have occurred eliciting opinions from some of the most able men, competent to advise in a matter of such professional importance. It has been argued, not in an exclusive or sectarian spirit, nor with preference to any particular part or class of art; for we should love them all with fervour; and it is this profound love which should lead us to desire that all styles of art should be upon a level and have fair play. Each of us may have and has his preferences, but this should not lead us to depreciate the qualities that exist in a style preferred by others. The report of this committee will be submitted for discussion to your consideration at our next meeting. The scheme proposed, suggests that "the instruction should embrace the drawing and modelling of organic forms with a view to the attainment by the student of such an accurate knowledge of their structure as should enable him to apply them in decoration with power and truthfulness, and to form an intelligent comparison of their treatment by the masters of every period of art, and in the monuments whether of ancient or modern times." To carry out such a purpose, proper instructors must be found, and other requisite means of study provided, as also the efficient and vigilant superintendence of the able scheme ensured by the earnest co-operation of the members of the profession. In addition to moderate fees to be paid by the students, it will be necessary in the first place, that liberal contributions from our members should provide the means for procuring the several requisites of fittings and conveniences to commence and carry on the school, and the committee rely upon your generous concurrence to furnish the funds for the purpose. . . . .

The self-respect of our members may be stimulated by the example of one of the highest dignitaries of the Roman Catholic Church in these realms. Cardinal Wiseman has recently delivered before the members of the Architectural Museum a lecture "On the Past and Present, and the Prospects of the Future for Good Architecture in London," and, I think I may add, "*in England*," if I may be permitted to follow up the scope of the remarks of his Eminence. We must all feel grateful that such a topic should have been handled by so high an authority, with such fine perception and discrimination for the monuments of our art, with so wide an acquaintance with its finest productions, and to so practical a purpose. It is of the utmost importance, when one so exalted in rank, and of such cultivated taste, vindicates that which is pure in our art, and raises a teaching voice to the profession, as well as to the public in general.

Nor can it be admitted that there are not topics enough, dark and obscure questions, still to be investigated and elucidated by our thoughtful architects. When the revival of classical literature produced, as a natural consequence, the revival of the study of ancient art and monuments, then the enlightened men of the sixteenth century applied themselves to the patient and earnest investigation of those relations which obtained in the edifices of classic antiquity. They laid down the rules and laws of proportion in regard to the orders, dimly shadowed by Vitruvius. These canons have been misunderstood and misrepresented in later times, and never more so than in the present. They were offered as elementary, liable to change as taste and refinement of perception might suggest; but they have been considered as arbitrary and empirical trammels to taste, and what were meant as merely proximate results have been assumed to be positive and final.

Mediæval art has not as yet been so investigated, and some may say it never can be. Can positive proportions be laid down as to the relations in size in the several parts of a column, the base, shaft, and capital? In the group of a range of mouldings? Or in the mutual relations of proportion in the apertures of doors or windows, or in their respective dressings? No law has been discovered in the relative bearings of piers, or openings of arches of naves in their breadth and height. The just width and height of a nave or tower, or spire, have still to be ascertained. Who has yet had the patience or grasp of mind philosophically to dive into the mysterious relations and parts which constitute the beautiful in the choir of Lincoln, in the nave of Westminster Abbey, in the façade of Cologne, or in the massive energy of Durham? Whence the source of the impressions which these remarkable structures produce?

I would also venture to suggest subjects still requiring investigation, such as the positivism reigning in some minds at variance with the idealism of the poetic temperament in others. Such consider that there is no room for beauty except in absolute stone, brick, or metal, as to the substance, and of use or usefulness as to the application; and that grace, expression, and meaning cannot exist except in some immediate materialism. They acknowledge no poetry or proper fancy, unless embodied in the rarer and more precious materials, and that sensuous impressions are necessary to give reality to those of mere abstract imagination.

Would it be unprofitable to inquire to what extent the happy genius of great artists may by an intuitive instinct have lived in an atmosphere of beautiful ideas and consciousness of grace, expression, and sentiment, so as to translate and embody them in their own creations, as by a divine afflatus? May it not be that in former periods the mysterious relations of beauty were known and laid down practically in positive canons, and that the great superiority of their works consists in the happy temperament of those artists, who felt most powerfully the best mode of applying those canons, so as to convey to others the impressions they themselves experienced and sought to excite?

In the divine order of the universe, it cannot be doubted that there are certain fixed laws of beauty dependent upon certain relations; upon a fitness, harmony, and proportion, as yet unrevealed, and consequently unascertained. So in art we recognise a like influence. It remains for some high intellect and discriminating mind to interpret these laws, and to penetrate and develop the mysterious relation by existing examples.

In what consist the grand peculiarities of Greek art? for its moral grandeur and unequalled purity are not merely legendary, nor is our admiration based upon our religious feelings, as is the case with Mediæval productions. Our recognition of their power is apart from all passion. Our reverence rests upon objects devoted to a distinctly different theological origin. We have no immediate affinity of customs, thought, or literature, in common with those of the times in which they were produced. May we not be considered as impartial judges, uninfluenced by considerations that might otherwise warp the judgment, when we bow with reverence to the mighty genius of the Greeks in art and in letters?

Not to mention the many curious and important questions in construction which arise from the numerous new materials and combinations of materials brought under the notice of architects and engineers, and their structural application, I may perhaps be permitted to suggest that the description of the many important buildings in course of erection will afford much instruction. Probably the greatest profit may result from such communications. It argues no assumption on the part of the architect, for he merely states the requirements he may have had to satisfy, the special difficulties he may have had to encounter, and the means he may have adopted to carry out his conception; and who can explain them so well as he? And we have witnessed such occasions at our meetings, when this plain, unvarnished, earnest, statement has riveted attention, and received the grateful recognition of all present.

I throw out these hints to show how wide a field there is for interesting papers. And in addition, there are the vivid impressions on the minds of those architects who visit the Continent, and who, whether in France, Germany, Italy, or other states, will have found much that ought to be recorded, both as to the productions of past and present times, and as to the place they should hold as works of art. Without the intention of depreciating any, we may be permitted to compare them with those of other periods and countries, to ascertain their true relative value, and to husband them as preciously suggestive. We should also observe the rapid progress made of late in France, where a new era of improvement has made gigantic strides, and architecture, under the presiding enlightened genius of a great mind, contributes to the convenience, health, and dignity of the metropolis and of the provincial towns.

How is it that the Crown, the Government, and the Parliament of Great Britain have a kind of paralytic atrophy of feeling in regard to their duty to endow the country with useful monuments that should add to its comfort, its embellishment, and its grandeur?—regarding each other with a kind of awe, lest the one should ask too much and the other grant too little; each thinking that adequate and appropriate buildings can be erected with a small outlay and a miserable disregard of the nobility of architecture; thinking that a grudging economy is not unworthy of a nation like ours, great in its political position among nations, and rich in its resources. Why are such buildings still to be desired as public offices for our departments, to replace the paltry hired accommodation rented at enormous sums? Why are the law courts of the metropolis, for which the funds are ready and lying idle, not begun? or the accesses to the new quays forming on the banks of the Thames at a stand-still? or the restoration of the Chapter-house at Westminster? or the chapel of the Holyrood at Edinburgh, a disgrace as a religious appurtenance to the palace of our Sovereign, not contemplated? or our harbours of refuge disregarded, as are many other such public works, demanded by the necessities of the nation or the feelings of the public? Why are such to find no place in the estimates of the Chancellor of the Exchequer of an empire whose actual income sits lightly upon it, though reaching to seventy millions? Is the realization of such wants to be left to future generations, and thus the present to be deprived of the enjoyment it ought to possess, if those at the head of affairs conceived their duties aright? Is it to be reserved to us to contemplate the accomplishment of such operations by the history of Imperial Rome of the past, or the example of enlightened Bavaria and Imperial France of the present? Is imperialism necessary for such high and lofty considerations? . . . . .

According to the wise regulations of our Institute, this being the second year that I have been called upon to fill, however inadequately, the duties of your president, the present is the last occasion on which I shall have to address you thus at length, and to reveal to you all my inmost feelings as to our art in reference to our profession. I trust, therefore, I may be permitted, without offence, and without wounding the susceptibility of others, to confess broadly and distinctly my own impressions of the importance of the study of Classic art, as a most essential element in the education of the young architect; and I do this at once to vindicate myself and the highest expressions of artistic thought.

There are those who consider Classical architecture as an incumbrance to the student in his educational career, and therefore ignore it, adopting a more recent class of art, without suspecting that they lose much by the omission; and, in fact, such minds do not lose much by such a conclusion, for the opinions of the learned are to them of little importance. There are others, however, who, without absolutely arriving at such a conclusion, still do not place much reliance on classical studies, and they require reasons why, when there are styles of so much more recent date, and more nearly connected with our history and customs, so much deference should be paid to what they call the alien productions of remoter periods, of distant lands, and of such different necessities and habits of living and thought. Let us now consider what the advocates for Classic architecture may adduce, and how the present style may be improved. All right-thinking persons agree that too much attention cannot be bestowed upon a subject which is calculated to inculcate purity of taste and high elevation of thought. The necessity is admitted of adopting the best models for the formation of correct notions of the beautiful in art. When any monuments of recent times shall have excelled the works of the Greeks and Romans in the full development of their magnificence and splendour, whether as regards their proportion, grandeur, fitness, and refined orna-

ment; and when any subsequent buildings shall have equally united through as many ages the general reverence of mankind, it will be time to discuss the relative pretensions of the two epochs to be considered supreme, as having embodied the soundest canons of refined taste. The architects of Greece and Rome lived in periods when art in those countries was at its culminating point,—when men of the most cultivated minds and of the highest intellectual status in such departments were engaged in discussing in the schools the laws of taste and the utmost refinements of thought. They laid down the laws of proportion with exactness. The sister arts of sculpture and painting were most refined, and the masterpieces of the highest genius were produced. Neither the one nor the other was obliged to depart from the truthfulness of nature in order to conform to the arbitrary peculiarities of architecture. Our own eyes see that the works of Phidias, Scopas, Bryaxis, Timotheus, Leochares, and Pythis were as full of all the just proportions, native grace, and artless pose, as if the living subjects themselves had assumed the positions in which the sculpture is grouped, and as if the statues were intended for independent purposes. Those artists worked for an intelligent people, and had not to seek adventitious means to make their works come home to the convictions of the multitude. No contortions of form; no excess of expression. The poetic fancy of the artists had its limit, and did not run wild. The sacred edifice did not admit the caricature of sacred subjects, but maintained a tone of feeling and thought removed from everything that was lowly, familiar, and debasing. No masked efforts in point of construction. It is amazing to think that Classical art, with all the magnificent remains we have of the genius of the ancients still existing, should be put upon its trial in England. It is true that the monuments are in ruins, that the completeness of their original state, with all their appropriate accessories and the maintenance of their actual use in our times, does not exist, as in Mediæval buildings; and that the fulness of Greek art is to a degree an abstraction, and can only be appreciated by those who have lovingly and profoundly studied the subject; and by so far it stands at a disadvantage with more recent phases of taste. But with such a standard of purity as that revealed by the monuments of Attica, of Asia Minor, and of Rome, not to mention the provinces enriched by the reflex of glory, that sheds its halo on such ruins as those of the South of France, and in Sicily and Pompeii; a school cannot wander far from the true path unless in ignorance it rejects all antique tradition. It must be an impatience of wholesome control, a disregard for sober authority, a wild license of thought and passion for novelty, that would disregard the rich inheritance of the influence of Classic taste; to cripple and destroy which is an act of barbarism and folly, an audacious attempt to throw back civilization, a high treason against good sense. For their temples, which are the highest expression of art in any people as being dedicated to the Deity, and coincident with the deepest feelings of devotion in the heathen mind, were objects worthy the acceptance of the Divinity. They were eminent in conception, choice in every detail, superb in embellishment, calculated to excite feelings of reverence and awe; stupendous as to size, striking as to position.

If we are to ignore the Classic and select the exclusive study of Mediæval art, as the most reasonable and masculine for the mind of youth, which period of Mediævalism are we to adopt? for our present advocates for Gothic architecture—and I speak in the presence of those who can correct me if I am wrong—are at variance in principle and practice upon this point. The three periods of Classic art show the progressive advance of taste, an enlargement of the sphere of invention, not an antagonistic process; for each one was perfect and harmonizing at the same time with the rest. All these could be adopted at the same time with perfect congruity. But shall we adopt the Byzantine? the Norman? the Early Pointed? the Decorated Lancet? or the Perpendicular, or Flamboyant? Will either admit a mixture with the other? We are limited to our one style. The Semicircular will not properly combine with the Pointed; nor the details of the pre-Norman with those of the subsequent epoch; nor the arch of this with the arch of that period. Where is the just ratio between the base, the shaft, and the capital? They are all various. Where the utility, except for show, of the column, elevated in the Classic to the leading maiestic feature of a monument, in Mediævalism reduced to mere shafts of decoration? What the laws of contrast between light and shade, when all the mouldings of a clustered shaft or reveal may be rounded off without a square or plane face to act in contrast and relief? Where the beauty of the exterior of buildings without breadth, cut up by the projecting and flying buttresses, evidences of weakness in construction, destroying all unity, quiet, and repose, and introducing instead a bustling busy succession of shadows, lines, and disconnected parts? What mean those niches with figures therein, following up the sweep of the curved vaulting of a cathedral porch, as if each effigy of solid stone were ready to fall on the head of the worshipper as he entered the sacred edifice? What meant all this magnificence of disposition, that costliness of decoration, that attention to animal luxury and comfort for the residences of men supposed to be devoted to ascetic self-denial? What that influence of art and material bestowed upon the memorials of monk and nun, abbot and bishop, so flattering to clerical vanity, and which the heathen did not admit?

Doubtless there are many daring flights of science and hardihood of construction, showing great skill and handicraft. But there is scarcely a cathedral which is not tottering on its legs, displaying rents and crevices, and threatening ere long entire ruin, unless timely repaired, after only five or six centuries of existence. Whereas there are the remains of monuments in Italy and Greece and Asia, which have survived the shocks of earthquakes, the barbarous violence of the destroyer, and the wasting havoc of time. Despite of all this, they present lines of columns surmounted by heavy entablatures, standing free and upright as on the day of their erection, and as though in their solitary grandeur they still defied the raging of the tempest, the fury of man, and the natural causes of decay and ruin. We conclude, then, that it is best for the student not to be exclusive in his taste, for there are elements of grandeur, fitness and elegance in all classes of art and in all periods. But to train the mind to appreciate the truly beautiful, he should select for his early studies the examples most severe in taste and most correct in form, as the best adapted for that purpose. His education, therefore, should be classical, perfected by a knowledge of all subsequent styles, including the Mediæval; and then he may adopt and exercise safely the one most congenial to his matured taste and experience; for then he will be unprejudiced, the slave of none, the master of all.

In thus frankly stating my views on the relative merits of the two great periods of our art, the Classic and the Mediæval, it is not my purpose to arrogate in practice the exclusive superiority of the one over the other. Each has its peculiar sphere of usefulness and practical application, and that a noble one—in the wants of the present period,—wants as regards taste, wants as regards use. The extreme Classicism is to my own mind as unsuited in many cases to our requirements as the extreme Gothic. Our domestic habits, our public requirements, nay, our religious turn of thought, in God's mercy, happily demand modifications to suit them to the actual and not imaginary state of society. We must not be acting as puppets, and, as on an ideal platform, play the part of bygone thoughts, feelings, and impressions, but work out the honest convictions of the present real stage of life. We may look back, but we cannot go back to the past. I pray you, then, not to consider me as inculcating partizanship in artistic life. It engenders a rivalry of the lowest kind; it embitters the emulation, which should on the contrary be generous; and it gives rise to enmity between those who should be friends: and such an unworthy motive-principle of action in a pursuit like ours, must be utterly repugnant to all honourable minds. The character of the profession depends upon the manner in which it is practised by its professors; and its status is fixed by the aims of those who stand highest in its ranks, and by the mutual respect in which the members hold each other. With noble ideas of art in the abstract, with a devoted love and reverence for the beautiful, all must seek to illustrate these qualities in their productions, irrespective of the applause of the critic or the unenlightened admiration of the public. Uninfluenced by mercenary views, by jealousy, or by selfish ambition, we must be forbearing and just to our brother competitors in the race, and judge them rather by the emanations of their skill and genius than with reference to ourselves. Under such influences the art becomes of noble growth, healthy, hearty, glowing with generous sentiment, and creating an atmosphere, a living principle, worthy of the best of times, and creditable to those engaged in the pursuit. An honourable profession like ours must be honourably pursued.

ROXBURGHSHIRE.

When a writer has spent thirty-five years in collecting materials for a work, he is entitled to be heard. He is not one of those who rush into print with the same careless haste as they who leap before they look. One may conclude that he has had time and acquired taste to winnow his materials of worthless or irrelevant matter. We may, at all events, give the historian of Roxburghshire credit for quite this much painstaking.* Mr. Jeffrey published the first volume of his history in 1836; the second in 1857; the third in 1859; the fourth has just issued from the press, and is by no means the least, either in bulk or value. It treats of the regalities of Melrose and Hawick; the baronies of Galashiels, Wilton, Minto, Hassendean, Cavers, and Bowden; the town and lands of Tessudden; the territories of Maxton, Lilliesleaf, and Liddisdale, with notices of their antiquities, architecture, manufactures, legends, agriculture, roads, eminent men, and indigenous plants.

One of the most interesting of these districts is Liddisdale, the tract of country on the Scottish border-land immediately opposed to the counties of Cumberland and Westmoreland. It derives its name from the river Lid, which flows through the vale, or *dal*, to join the Esk. In Saxon times King Edmund granted the English counties mentioned to Malcolm, king of Scotland, on condition that he would protect the northern part of England, by sea and land, against all comers, in testimony of which gift a cross was erected at Stanmore, on the confines of Westmoreland and Yorkshire, sculptured with the arms of England and Scotland. This grant was the origin of a long series of contentions, involving the burning and pillaging of the district over and over again. The question of the rightful ownership of these lands was contested through the reigns of several sovereigns of both countries, but remained unsettled till the middle of the thirteenth century, when King Henry agreed to assign lands of the yearly value of 200*l.* within the counties of Northumberland and Cumberland to the King of Scotland, if lands of that value could be found without the limits of those towns where castles were erected. In virtue of this agreement, the baronies of Penrith and Sowerby were assigned to the Scottish Crown, when Kershope water, a fork of the Liddel, became the limits of the kingdom. Thus early sown with the horrors and barbarities of warfare, the soil seemed capable of bearing no other crop. Down to the middle of the sixteenth century Liddisdale was a stronghold of lawless men, and the haunt of freebooters. Duels and assassinations were common occurrences. One of the earliest atrocities recorded was the murder of Ranulph de Sules, the chief noble of the dale, in Liddel's *strength* or castle, by his domestics. William de Douglas, a subsequent owner of this noble's lands, became possessed of them by slaying an intermediate possessor of them while out hunting. The same William de Douglas seized Alexander Ramsay, the Sheriff of Teviotdale, and starved him to death in a dungeon of his doubtfully-gotten castle in Liddisdale. He also killed Spens of Kilspendie in a duel. After this last "gentle passage of arms," Angus said to the attendant of his slain foe,—"Go thy way: tell my gossip, the king, that here was nothing but fair play. I know my gossip will be offended, but I will get me into Liddisdale, and remain in my castle of Hermitage till his anger be abated." The contumacious earl, however, did not get off so easily on this occasion as he expected to do; for the king compelled him to exchange territory with the Bothwells, as he found himself unable to exert any authority over him as long as he retained possession of Liddisdale.

There were seventeen clans on the Scottish border: of these Liddisdale had two—the Elliots and Armstrongs. They were all bold, brave men, given to *riding*, or making sallies into other

* The History and Antiquities of Roxburghshire and adjacent Districts from the most remote Period to the present Time. By Alexander Jeffrey, F.S.A., Scot. Vol. iv. Edinburgh: Beton & Mackenzie. London: Whittaker & Co. 1864.

clans' territories for the purposes of plunder. The Armstrongs believed themselves to be descendants of one Fairbairn, an armour-bearer to one of the early kings of Scotland, who rescued his dismounted sovereign from danger by lifting him by the thigh, and setting him upon his own saddle. The Armstrongs attributed their name to this feat, and their possessions on the border to the king's gratitude. Their crest they considered a token of this deed, an armed hand and arm, in the hand a leg and foot in armour, couped at the thigh, all proper. In one of the royal MSS. preserved in the British Museum, dated 1590, it is set forth:—"The chiefe surnames in Lyddesdale stand upon Armstrong and Elwoods. The chiefe Armstrong is of Mangerton, and the chiefe Elwoode at Lariston. These are two great surnames, and most offensive to England at this daie, for the Armstrongs both of Annendale and Lyddersdale, be ever ryding."

Mr. Jeffrey has printed a *fac-simile* of a map attached to the MS. quoted above, which shows that the banks of the rivers Liddel and Hermitage, and their branches in this valley, were studded with pele towers. Near the source of the Liddel stood the pele of Martin Crosier. A short distance from this, on the right bank of Helcaldron Burn, was that of John Copshaw. Going southwards, there were the towers of Sim Elliot, execrated in the ballad of "Hobbie Noble;" of Ladiesfaine, from whose owner all the border Elliots are descended; of Clints; of Castelton; of Potterlain Park; of Whithaugh; of Copshaw, the residence of the famous Johnnie Elliot, from whose wound Bothwell was suffering when visited by Queen Mary, in Hermitage Castle; and of Syde, where lived "Jock o' the Syde:"—

> "He is weel kend, Johne of the Syde,
> A greater thief never did ryde,
> He never tyris,
> For to breik byris
> Ower muir and myris
> Ower gude and gyde."

Only a little to the west of the site of the tower of this famous Armstrong are the remains of another, the Puddingburn Ha', where "Dick o' the Cow" performed the exploit of stealing back his own stolen horse from the Armstrongs, together with one of their best, after *tying the rest with St. Mary's knot*, or cutting their hough sinews to prevent pursuit. This feat is regarded as the more expert because, when it was executed, the Armstrongs were feasting upon "the fool's own cow." Opposite the Syde stood Mangerton Tower; and near it Green Ha'. Hermitage Castle, the chief "strength" of Liddisdale, is in the same locality. Two miles above it stood Goranberry Tower, a pele that was inhabited by a family haunted by a Cowie. This supernatural being took great interest in the execution of the various tasks required for the family's comfort, and very frequently performed very useful offices for them in the night; but he was most valued for the intimations he gave when death was making its approach. He announced this event always a short time beforehand, with wailings of touching intensity. It was not until the last representative of the line was gone that he discontinued the practice. Below Hermitage Castle there was a tower called Milsholm, and another called Hartsgarth, on a burn of that name. Another pele stood at Roan, and not very long ago, when some alteration was about to be made to it, a slab was turned over in the cellar which had the following puzzling lines incised on the under side:—

> "I am set here baith firm and dry,
> That sic up and baup may in me lie;
> Blame me not when you be cold,
> For I am neither in house nor bold."

Between fifty and sixty peles stood in the limited district depicted on this map of Liddisdale. They were for the most part square towers, differing only from Northumbrian peles in the Scottish character of the details. Some of them were on a larger scale than others. They were provided with court-yards inclosed by strong walls, fortified by battlements and turrets, into which the owners' cattle was driven at night, or on alarm. The turrets were thrown out upon corbels and capped with conical roofs. The basement chambers were always stone-vaulted. But few of the large number mentioned are still standing, owing to the literal interpretation and prompt execution of the mandate of James I. of England and VI. of Scotland. He commissioned Sir Walter Selby to enter Liddisdale and raze every place of strength to the ground, so that the two countries might be the more effectually amalgamated. In place of the square-set towers that had weathered so many storms and seen so much service, farm-houses began to appear upon the wild moorland scene. It is probable that many of these were built upon the sites of peles and incorporated their remains. As time passed on, all sense of insecurity vanished, and clay and thatch were used as building materials for purposes where stone walls 4 ft. thick were formerly deemed indispensable. The scores of small dwellings wrought of these frail substances looked ruinously picturesque before they were very old. Under the judicious ownership of the Duke of Buccleuch, they have now become as scarce as peles, and even the more recent thatched cottages are being superseded by wholesome slated houses.

There were no roads in Liddisdale a hundred years ago. The traveller had no choice of conveyance: there was nothing for him but the saddle. Every pack of merchandise, every basket of country produce, was carried to its destination on horseback, over moors, bogs, and mosses. There was not one bridge over the rivers Liddel and Hermitage in a run of twenty-six miles, in 1792, and the traveller had to ford them over and over again as they wound into his route. There are now two railways traversing the valley; and this district of freebooters, where the eagle was seen carrying off a lamb not many years ago, and a crane was shot only last summer, is fast being converted into a soft pastoral landscape.

The interest of the regality of Melrose is of a different order to that of Liddisdale. But this, in its monastic connexion with Melrose Abbey, and its literary and romantic association with Sir Walter Scott and Abbotsford, has been so frequently treated, that we turn to a district of which less is known, as a sample of Mr. Jeffrey's materials. The barony of Galashiels has a special claim upon our notice, because it is situate in the forest of Ettrick, the tract of country with which James IV. endowed his English bride, Princess Margaret. *Gwala* is the ancient British name of the river, and *shiels* is the Saxon word by which shepherds' huts and farm buildings are still called in the north. The ancient town consisted of two streets, with a tolbooth, market cross, and pele tower. The church appears to have been built on the opposite side of the Tweed, and to have been rebuilt on the north side, as a kirk, about 1622, when a report of the commission for the plantation of kirks gave 400 as the number of the inhabitants. About this time the woollen trade was represented by three *waulk-mills*, each paying a rent of 5*l.* per annum. As these were exposed to the elements they were useless in frosty weather, therefore the whole of the male population of the place were compulsorily idle at such seasons. As a relief to the discomfort of this state of things, the laird and parish minister repaired to the market cross, and summoned the frozen-out workers, by bell, to accompany them to the *haugh*, to play at *shinty*. All the men of the names of Hab, Jock, Tam, Andrew, Adam, and Dan, formed one party, and played against the men whose names were not included in this category; and at the end of the game both sides repaired to the manse, where they were regaled with the Scottish dish *nolt's head and brose*. At that date the wool was distributed to 240 women, living in the neighbouring villages and hamlets, for them to card and spin in their own houses. On Saturdays they brought their work into the town, and were paid for their industry at the rate of sixpence per *slip*. In 1780 the first movement towards the adoption of machinery was made, when a *willy* was put up in a garret, and its owner *willied* for the whole town. The next step was the introduction of the carding machine from Leeds. Then followed the covering-in of the Wilderhaugh mill, and the erection of a small wheel to drive the new scribbler; and the rapid adoption of one improvement after another, the building of new mills and application of steam-power. There are now sixteen mills at Galashiels, or sixty setts of machines, and the trade carried on is estimated to be of the annual extent of 420,000*l.* The armorial bearings of this thriving burgh consist of a plum-tree, with a fox sitting on either side of the trunk of it, looking up into the branches. The motto is "*Sour plums.*" This device is interpreted as a memorial of a successful fray with some Englishmen, who had wandered from the main body of the army of David II., in search of the plums which grew in the woods around and on the banks of the river. The Galashiels men turned out to punish their temerity, and slew them all to a man, throwing their bodies into a ditch, known to this day as the Englishmen's Syke. The sour plums are the wrathful proprietors of the sweet plums, of which the thirsty stragglers were in search. Their exploit was handed down in an old song, and the tune "Sour plums in Galashiels" is in great favour among Scottish pipers.

Mr. Jeffrey has touched upon a subject that has caused as much wonderment among the antiquaries of the north, as the incised sculpturings on rocks recently noticed in these columns. This is the occurrence of a number of terraces, one above another, on certain hill slopes, both on the English and Scottish side of the border. They form wide, smooth, level, regular platforms, and are noticed most frequently towards the summits of the hills on which they occur. There are as many as a dozen tiers of them on some hills. The local name for them is *baulks*. The first question that arises is, are they natural or artificial? are they bank-like deposits left by the subsiding of mighty waters, or are they the work of man? They occur on a ridge of hills forming the east side of the glen of Edgerstone, on the Cayle and Capehope waters, near Hownam, at Belford, on the Beaumont, on the Reed water, at Heathpool, on the Colledge, and at several other places in Northumberland, and on the Cheviots. Gordon, in his "Itinerary," gave an opinion that they were Roman itinerary encampments. Pennant and Wallis (the historian of Northumberland), concur in deeming them places for the militia, to arrange themselves upon in time of war, so as to make the most imposing show. Those antiquaries who cherish strong Roman predilections, believe that they are Roman corn-fields. Mr. Jeffrey's own view is different from all these. Pointing out the fact that the Britons had a considerable knowledge of agriculture before the Roman invasion, and, indeed taught their conquerors the use of marle and of the flail, and that in the fourth century there was enough corn grown in Britain to save the inhabitants of the towns and villages on the Rhine from the horrors of famine, he thinks these terraces are either the works of the ancient Britons or of the Saxons. The early abbots of Melrose and Kelso were great farmers, and possessed granges in every district in this part of the country, and so may be reasonably accredited with these curious relics of high farming. On the other hand, these hanging corn-fields are also in the neighbourhood of ancient British remains. In the valley of the Breamish, where there are sites of Celtic huts indicating a population not less than 500 in number, there may be counted sixteen terraces, varying from 10 ft. to 40 ft. in width, on one hill, and several other hills bear traces of cultivation, in a similar manner, to an altitude of 1,000 ft. above the level of the sea. As the low-lying lands in these districts were bogs and forests, we must conclude that the sides of the hills offered the greatest facilities for cultivation, and that they were accordingly used by the first occupiers of the soil in the same way that every patch of ground suitable for a vineyard is picked out by the vine-growers on the steep hill-sides on the Rhine at the present day.

Hawick is just now augmenting its manufactures at a pace that promises to place this town in the foremost place in the south of Scotland. Several public buildings have been erected recently, besides a number of houses; and, generally, there is an aspect of prosperity in its streets. The trade of Hawick began with the sale of the yarn spun by the women of the district of winter evenings. This was either sent to Kendal, Boroughbridge, or Stirling, or sold at the fairs to *riders*, or bagsmen, from England. In the middle of the last century, four men established a carpet manufacture, which was speedily extended to that of carpet-covers, table-covers, and rugs. In 1771, one of the magistrates started the manufacture of stockings with four looms. In 1787, cloth was added to the productions of the town; and early in the present century woollen plaiding and blankets were manufactured. The tweed trade has opened out fresh resources, and run the estimates of the yearly value of the trade of Hawick up to 250,000*l.* sterling. Mixed up with the new mills and flourishing shops are the remains of the ancient town. Here and there may be seen one of the old houses which indicate the style of the former homes of the inhabitants. The ground-floor was appropriated to the cattle; the second story, to which access was gained by an external stair, was the dwelling. Many of the ill-ventilated closes and wynds are still densely inhabited,—an unsanitary arrangement which the town council would do well to look into.

ARCHITECTS AND THEIR PUPILS.

If we may judge from the tone of a number of the letters we have received on this subject, the course pursued with pupils by those to whom they are articled is much more satisfactory than was once the case. A few years ago a complaining letter such as that of "A. P." would have brought us a dozen echoes and no contradiction; whereas the majority of those we have now received deny that pupils generally have much to complain of, and many of them condemn him as taking a wrong view of his position. For example, "Another Pupil" thus writes:—

"In common justice to the architectural profession, will you permit me to offer a few comments upon the letter of 'A. P.' which appeared in your pages? Instead of making out his case to be a very bad one, 'A. P.' proves himself to be in very advantageous position, for he tells us that all the work is done by pupils;' and surely, if his employer has anything like a fair share of practice, there must be more opportunities for acquiring practical knowledge than if the work were entrusted to experienced assistants. 'A. P.' proceeds to complain that no time is allowed for study. This appears little short of absurd. Does he expect his master to grind him in those subjects which should have been mastered at school? A pupil enters an office to study the application, and not the investigation of principles. If 'A. P.' grudges a few hours in the week for study, the sooner he gives up the 'profession' the better. It was not by only working eight hours a day that Barry or Chambers rose to fame.

Of books there can be no lack in London at least, and every country town of any importance has its Mechanics' Institute. Why, sir, at Kensington Museum access can be had to standard works of every description. Every comfort is provided for study, and the charge is only 10s. per annum. The Museum is open till 10 p.m. for three evenings a week. With such opportunities there can be no room for complaint. If 'A. P.' will remember and apply the proverb, 'Where there is a will there is a way,' all difficulties will vanish."

Hear a third pupil:—

"'A. P.'s' letter appears to me to be dictated by feelings of remorse for time misspent and opportunities wasted, and causeless spite against his master, because he did not make him study and learn his profession. But, granting his complaint to be just, and his misfortunes real, why does he take his case as the sample of all others, and say that 'all the benefit a pupil generally obtains from his articles is simply a knowledge of mechanical drawing?' Surely it is a reckless supposition.

My own experiences are totally in opposition to the views contained in 'A. P.'s' letter. I am articled for 4 years, about 2½ of which have expired, and I think I may fairly say that I do possess a moderate knowledge of the various branches of science, the loss of which 'A. P.' so bitterly laments, viz.—mathematics, mechanics, acoustics, chemistry, shoring, materials, and the history of architecture; and have acquired it, too, from no over-application of my own, but rather from the personal teachings, precepts, and kindly endeavours of the gentleman I have the good fortune to be articled to. My work has always been allotted by him, as that most likely and most calculated to improve my knowledge of the art, even at times to his own great inconvenience."

"An Old Hand" is more severe on A. P., but we can give only a part of his letter:—

"'A. P.' pathetically inquires 'where is his knowledge' of sundry sciences? That is his look out. Does he suppose his master is to keep a school and supplement his evident want of early instruction? Surely, with only eight hours out of the twenty-four nominally in the office, he could find two or three hours a day for study, and still have time for recreation. But 'I don't know what young men are coming to.' When I was a pupil a generation ago, office time was nine hours a day, and no half-holiday on Saturdays; and all my knowledge of the theoretical part of the profession was learnt out of office hours. So it is in every architect's office, in every lawyer's office, in every medical man's surgery. The system of apprenticeship is only meant to teach the apprentice the *practical* part of a profession, whatever profession that be: the study of the *theoretical* must be carried on in the privacy and quiet of home. Take the advice of an *old hand*, young gentleman, and remember that an apprenticeship is a give-and-take arrangement for the *mutual* benefit of both master and pupil: that if you make yourself agreeable and useful you will be appreciated and assisted both now and through the future."

A letter from a well-esteemed architect, signed "F. I. B. A.," may serve to close our extracts from a somewhat bulky correspondence:—

"I observe in the *Builder* with pain, a letter from an articled pupil complaining of the difficulties which beset him; and I wish, in a kindly spirit, to say a few words upon this very delicate question. An architect's pupil is an apprentice, and he is bound to do what his master requires, even though it be to run errands connected with his business. The master is not bound to give lectures on mathematics, ventilation, &c.; but he *is bound* to teach his pupils the 'art, profession, or mystery' of architecture. How this is too often done our friend Pecksniff, I fear, has too truly set forth. There is, no doubt, much misapprehension on both sides; but, as an old practitioner, I may be allowed to say no architect ought to take a pupil unless he can, *by actual practice*, show him 'how to do it;' and that no pupil ought to suppose that, by walking down to his master's office and copying drawings, he is acquiring the knowledge he seeks. Both parties must *work together*, the master imparting his knowledge freely and in a kindly spirit, and the pupil diligently studying both at office and at home, and using all the means at his disposal to acquire knowledge. The result will, I am sure, in such case be satisfactory."

VISIT OF THE METROPOLITAN BOARD OF WORKS TO EDINBURGH.

On Monday, in last week, the Metropolitan Board of Works, including Mr. J. Thwaites, chairman; Mr. Creasy, his secretary; Mr. Freeman, chairman of the Main Drainage committee; Mr. Bazalgette, chief engineer to the Board; and about twenty-five members of the Board, paid a visit to the Craigentinny Meadows, at Edinburgh, to inspect the system of irrigation by town sewage which has for years past been carried on there. The members of the Board were accompanied by Mr. M'Pherson, superintendent of streets and buildings. The party first visited the Restalrig Meadows, along with Mr. Scott, the tenant, who explained the process by which the meadows were irrigated with the sewage that flows down from the city. The members of the Board were next conducted to the Figgate Whins, by Mr. Bryce, manager to Mr. Miller, the proprietor of Craigentinny Meadows. The gentlemen comprising the party were then shown about 20 acres of ground, which was originally sand, and worth only about 12s. 6d. per acre, but which, by the application of the sewage manure, had at a small cost been converted into rich and fertile soil, which had during the last thirty-five years yielded rentals varying from 20*l.* to 30*l.* an acre. Several members of the Board, according to the *Scotsman*, expressed their satisfaction at this gratifying result.

THE MANSION HOUSE.

The retiring Lord Mayor (The Right Honourable William Lawrence) and the Lady Mayoress, received, at a *conversazione*, on Friday evening, the 4th, some eight or nine hundred members of the Corporation and private friends, providing for their gratification many interesting specimens of ancient, Mediæval, and modern art. These comprised cases of illuminated manuscripts and autographs from the library of Mr. Tite, M.P.; antique coins, seals, and medals; paintings in water-colours by Turner, Copley Fielding, Fripp, Carl Haagg, Jopling, D. Cox, and D'Egville; an oil painting ("The Bird in the Hand") by Michael Halliday; engravings, and some very curious bronze vases from Japan. The new art of photo-sculpture, too, was illustrated by a collection of statuettes, many of them of public men, so that every one was able to form an opinion of the development that an art, as yet in its infancy, is likely to receive.

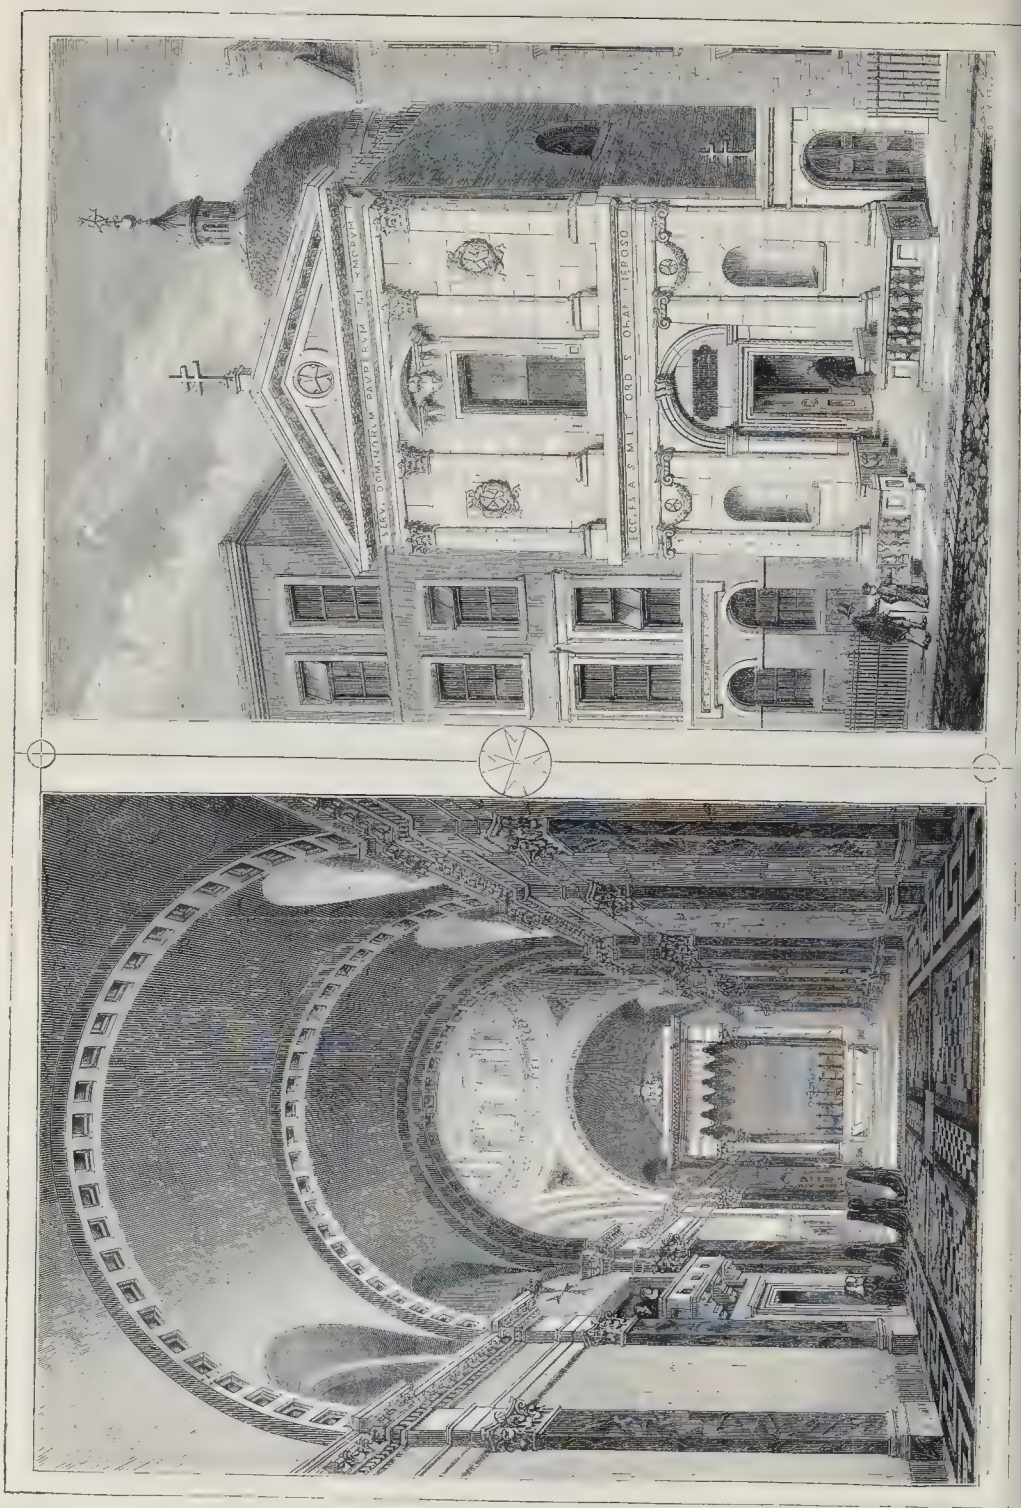
In the course of the evening a concert was given in the Egyptian-hall, in which Mr. Santley, Madame Verralli, Miss Louisa Pyne, Mr. Charles Adams, and M. Lotto took part, Mr. Benedict presiding at the pianoforte.

It was a good idea on the part of Alderman Lawrence to bring together his friends to wind up socially the year of office. He has thus shown, and by a large dinner a few days previously, his determination that no lack of hospitality should be attributed to his year of office, although he could fairly have pleaded a sufficient excuse in the sorrow which fell upon his family. His last public act, and one to be long remembered, was the formal opening of Southwark Bridge to the public free of toll, on Tuesday last. Although ostensibly this removal of the toll is but temporary and as an experiment, it is not likely that it will ever be re-imposed. The long-needed new roof to the Guildhall, of which we have given an illustration, also belongs to his mayoralty.

NEW ROOF, GUILDHALL, LONDON.

The new roof in Guildhall, of which we give an illustration this week, is now on the point of completion, from the designs of Mr. Horace Jones, the City architect. The work was commenced as recently as the 22nd day of June last, when the first stone of the new internal cornice was laid by Mr. John Keldey, chairman of the committee, assisted by Mr. R. J. Chaplin, chairman of the City Lands Committee, and Mr. T. Lott, F.S.A., deputy. The length of the hall is 153 ft., and the span of roof 50 ft. The roof consists of eight bays, two of which are not seen in our view. A number of temporary gaseliers, by Dodson, of Fetter-lane, are attached to the timbers. The work has been carried out by Messrs. Geo. Myers & Sons.

THE R.C. CHURCH OF ST. JOHN OF JERUSALEM, GREAT ORMOND STREET, LONDON.



We have before now mentioned the church and hospital in Great Ormond-street, generously founded by Sir George Bowyer, stating that they were erected from the designs of Mr. G. Goldie. In our present number we give an interior and an external view of the church. The façade of the exterior is of two orders, Ionic and Corinthian. Upon the upper cornice is inscribed,—

"Servi: Dominorum: Pauperum: Infirmorum:"

and on the lower are the following words:—

"Ecclesia: S: Milit: ord: S: Johan: Hierosol:"

In the pediment is the cross of the Order of St. John of Jerusalem, and the Imperial crown and shield adorn the window, which forms a feature in the upper order, flanked by two sculptured wreaths. The principal entrance doorway is adorned with carved details, and is surmounted by a marble tablet, on which is commemorated the fact of the foundation by Sir George Bowyer. The whole of this front is of Portland stone. The church within presents a parallelogram, measuring 76 ft. by 26 ft. Slight recesses stand in the place of transepts, and beyond them is the choir for the religious of the adjoining convent and hospital, whilst between rises the cupola, measuring 24 ft. 6 in. in diameter, 37 ft. above the ceiling of the church, and 74 ft. from the floor. The lower portion of the church, which forms the nave, has a vaulted ceiling, embracing lunette windows in the groins, and spanned by richly-panelled arches. An elaborate cornice runs round the church below the ceiling, and rests on pilasters of the Corinthian order, all formed of polished red marble, with marble bases and plinths. At the upper end of the nave a doorway gives access to the hospital, and above it, carried on carved stone consols, is a tribune of polished alabaster, opening into the lowest ward, for the use of the sick. The floor of the nave is of coloured tiles, arranged in a fret pattern. A marble step lifts the sanctuary floor above the nave level, and this upper floor is entirely composed of white marble. The high altar stands immediately beneath the centre of the dome, and is surmounted by a baldachino of marbles of various colours, with a panelled ceiling of wood. Two side altars, both ancient, stand on either side in the small transeptal recesses of which we spoke above. The nuns' choir, behind the high altar, is fitted up on three sides with stalls, in mahogany and pitch pine, with carved elbows, and inlaid crosses of the Order of St. John, all polished. Against the extreme end wall of the church is a large tribune, carried on stone brackets, with a gilt lattice front, for the organ. This opens into the convent staircase immediately adjoining. The whole of the interior is decorated with gilding and colour, the latter, however, very sparingly used at present.

THE NEW ROOF OF THE GUILDHALL, LONDON.—Mr. Horace Jones, Architect.

BOULOGNE-SUR-MER.

THE position of Boulogne on the coast, and its proximity to England, rendered it from the very earliest times a convenient point of departure for invasion on the one hand, and the scene of frequent reprisals on the other; and the history of the place, particularly during the Middle Ages, is a continued record of various expeditions undertaken against England, followed by surprise or siege of the town by the English, who generally laid waste the country as far as practicable, ending with a treaty of peace, or a marriage between some unlucky scions of the opposing royalties, neither of which proceedings prevented hostilities shortly breaking out again, and pursuing the same course as before.

Now-a-days, however, a very different state of affairs exists between the two countries: the Boulonnais not only tamely submit to an invasion, which commences in June, and continues to the end of October, but employ every artifice to attract their former foes to their shores, and by studying their tastes and peculiarities, endeavour to induce them to remain among them. Instead of seeking, as of old,—

"To charge the Volscian home,"

they very much prefer fleecing the stranger abroad, and the innumerable bills, announcing "English spoken," "Furnished Apartments," "Pale Ale," and so forth, indicate that they do not even shrink from braving the difficulties of our language, in order to conciliate our friendship and secure our custom,—a sacrifice which every one who is at all acquainted with the French character will not fail to appreciate at its due value.* Nor is the alteration less marked with our own countrymen; they make excursions to the column intended to commemorate the subjugation of Britain; they traverse indifferently the steep zig-zag path from the site of the *Baraque de l'Amiral*, down which, as a tablet on the wall informs us, the Emperor Napoleon I. descended on horseback at a galop, in the year 1804, and can afford to smile at the statue of the emperor, in the traditional attitude, looking out across the sea towards England, erected by an enthusiastic but slightly unconsequential Briton, according to an inscription (now half effaced) on the pedestal, "on the spot occupied by the tent of the emperor, at the camp of Boulogne, in 1801, and inaugurated on the 14th June, 1856, the day of the baptism of the Prince Imperial, the fourth year of the reign of Napoleon, after the signature of the treaty of peace which terminated the war in the East, and which was carried on by the Allied Armies of France and England."

Boulogne is a very pleasant place of resort in the autumn months, and has been much improved of late years, although the evil odours which assail one's sense at frequent intervals indicate a state of things as regards sanitary matters that needs timely attention on the part of the authorities. It does not do to be too severe, however, in our criticism of these defects, looking to the condition of our own watering-places, and the very recent recognition by local governing bodies in Great Britain of the connexion between drainage and the public health. The municipality of Boulogne are, in many things, far ahead of similar institutions in our own country, and carry out their improvements upon a much more liberal and comprehensive scale than seems possible with us. The new Etablissement des Bains, completed last year, is of quite a monumental character, and in point of size, style, and arrangement is far superior to anything of the kind I am acquainted with in England. It contains a ball-room 93 ft. by 42 ft., which occupies the whole height of the building, the roof rising above the other portions and forming a distinctive feature. Around the ball-room, on the ground floor, are grouped other rooms,—drawing-rooms, refreshment-rooms, &c. On the upper floor are billiard-rooms, smoking-rooms, a ladies' music-room, a card and conversation room; and in front, towards the sea, is a gallery overlooking the ball-room. There are besides, a gymnasium, a swimming-school for both sexes, a croquet lawn, and various games to pass away the time agreeably. The building is of the usual modern French style, with very bold window openings and narrow piers, which, however, do not give any appearance of weakness to the structure: this has, on the contrary, a very solid although graceful air; and it is only at night, when the inside is lighted up, that the extreme slightness of the points of support is noticeable. The architect was M. Debayser, of Boulogne, whose design was chosen in competition.

Very extensive works are in progress for the new floating dock to the west of the port, on the site of a smaller dock, in which the famous flotilla of gun-boats intended for the invasion of England was moored, but which gradually silted up. The works were commenced in 1860, and are expected to be completed in the course of next year. The new dock covers about seventeen acres; the entrance is on the north side instead of on the east, as formerly, and the waterway between the jetties will be considerably increased when the works are finished.

The Calais railway is proceeding very slowly, but appears to be really approaching completion. It has now invaded the garden of the Tintelleries, which it crosses in an open cutting, and thence passes, by a tunnel, under part of the fortifications of the upper town, and finally runs into the terminus of the Northern of France Railway at Capécure, with a very sharp curve, by a bridge over the River Liane.

A new fish-market is building on the Quai des Bains, which will very materially add to the comfort and convenience of the city. The market, which occupies a wedge-shaped piece of ground between the Rue de l'Amiral Bruix and the quay, nearly opposite the Hôtel des Bains, covers an area of about 15,000 square feet, and has a frontage of nearly 150 feet towards the port. It will contain separate markets for the wholesale and retail trade, an auction mart for the sale of fish, a large assembly-room for trade meetings, and offices for the various [illegible]. The stone is from Creil, near Paris, with the exception of that used for the basement, which is from the quarries of Marquise, near Boulogne, and the roof is to be of wrought iron. The architect is M. Lérenx, of Paris, and the probable cost will be about 8000*l*. There is no contract, but the work is to be measured and priced according to a schedule.

There are but few new secular buildings erected of late years, but those few are generally in good taste. The new bank of M. Adam, late mayor of Boulogne, is a very successful work of its kind; and a house in the Rue Napoléon, belonging to M. Devisme, and another in the Rue du Bras d'Or, now erecting, are among the notable examples of recent improvements.

The building of the cathedral is still going on, under the constant supervision of M. l'Abbé Haffreingue, who has devoted more than forty years of untiring devotion to the work, which is now almost finished, at least as far as the body of the church is concerned, and will, I trust, shortly be sufficiently completed to enable the self-sacrificing founder to see his designs realized before his death. This enterprising man is not satisfied with merely completing the fabric of the cathedral, but has commenced decorating the Lady-Chapel and the round church at the east end in fresco, which is being executed by M. Soulacourt, of Paris, and already considerable progress has been made. The crypt under the cathedral is very interesting, and contains some very fine thirteenth century painting, and some curious Romanesque work, although it is to be regretted that the ancient wall-painting has been supplemented by some modern imitation, as well as some figures of saints in chiaroscuro of a most barbarous character.

The church of St. Alphonse, in the Rue Wissocq, has just been cleaned and redecorated, the capitals carved, and the roof diapered with gold stars on a blue ground. This church is by Mr. Hansom, of Clifton, and was consecrated in 1860. It has a wide nave, and the groined roof gives it a lofty appearance; but the details are unmistakably English in character, and the general effect is very cold and depressing.

The Church of Saint François de Salles, at Bréquerecque, by the same architect, is a much more pleasing building, and is of yet more recent construction. Its style is Romanesque, and its plan and details are quite French in character, and consequently more appropriate to the locality. The church exhibits, also, some very ingenious peculiarities of design which are worthy of remark, the confessionals being grouped together in an arcade on the south side of the nave, and the stations of the Cross are formed by *bas-reliefs* on the walls, by which means two very ugly features which disfigure most Roman Catholic Churches are made subservient to the general effect instead of spoiling it, as is usually the case. The capitals of the columns, corbels, &c., which are intended to be carved are, for the present, left in block,—a common practice in Boulogne. The *grille* enclosing the Lady-e Chapel is a literal copy of the celebrated one from the Cathedral at Viterbo, and was executed, I understand, by Messrs. Hart. The high altar is of stone, and is very well carved; there is a fine wooden pulpit, and a very ghastly mortuary chapel at the western end, covered with death's heads and cross-bones in the worst possible taste, both from an æsthetic as well as from a religious point of view.

The Museum, which is located in a large building formerly called the Grand Séminaire, a missionary college which was suppressed during the Revolution of '94, contains a very respectable collection of antiquities, chiefly donations—

"Every clime and age
Jumbled together; celts and calumets
Claymore and snowshoe, toys in lava, fans
Of sandal, amber, ancient rosaries,
Laborious orient ivory sphere in sphere,
The cursed Malayan creese, and battle clubs
From the isles of palm."

Tennyson's words describe their arrangement, or rather want of arrangement, admirably, and the effect upon the mind, upon looking over the miscellaneous curiosities, is something very little short of a nightmare. The Natural History objects are, however, very well arranged, and there is every facility afforded for study and comparison. The country to which each specimen belongs is indicated by the colour of the ticket on which its name is written thus:—Yellow signifies it is a native of Asia; blue, Africa; green, America; rose, Australia; white, Europe; blue stripe, Department of Pas de Calais.

There are a few Egyptian antiquities, probably some of the spoils of Egypt under the First Napoleon; among others, two very fine sarcophagi, one with the mummy partly unrolled, standing upright, and grinning horribly at the spectator. There are some Greek and Etruscan vases, a very large Greek wine-jar in excellent preservation, and a fine Romanesque font from Wierre-aux-Bois, about ten miles from Boulogne, which has lately been added to the museum.

Boulogne exhibits a very good example on a small scale of the advantages of an appropriate system of street-naming. The names of all the streets are affixed in conspicuous positions in white letters on a blue ground, apparently enamelled on iron. The ancient names have been generally retained; and where any alteration has been made, it has been with an object: thus the Rue de l'Ecu is now called the Rue Napoléon,—a change which sufficiently indicates its date as well as its purpose. In others the alteration has been made with the intention of doing honour to some distinguished citizen: thus the Rue Tant-pour-tant-Paie is now called the Rue de l'Amiral Bruix, and the open space in front of the Hôtel Christol is called the Place Frédéric Sauvage, in memory of Frédéric Sauvage, who is said to have discovered the principle of the screw-propeller, and who was a native of Boulogne, where he was born in 1786. There are few traits of character more agreeable than the respect and recognition which celebrated men receive in French provincial towns from their fellow townsmen. In the case of Frédéric Sauvage, it is intended to erect a statue in the centre of the square called by his name; and it would seem that the Boulonnais are not alive alone to the merits of their compatriots only, as they have resolved to erect a statue to Dr. Jenner, to commemorate the introduction of vaccination into France, which took place at Boulogne, and the statue, which is of bronze, will be shortly placed on the Quai des Bains. Whenever the name of a street indicates its position or direction, it has been preserved, and some of the names serve to point out ancient localities which would otherwise have been overlooked or forgotten. The Rue du Jeu de Paume, the Rue des Religieuses Anglaises, and Rue de l'Ancienne Comédie are cases in point, and many others might be

* Some of the attempts at English are very ludicrous: for example, on a board in the Rue de l'Ancienne Comedie are the words:—

"Litthe Carriages
Bath chaise let
english."

Another board announces:—

"Donkey hirer
to Let."

and on a house in the Rue Royale is the following inscription:—

"Ici
on maungle
le linge
maungled."

The *Monde Illustré*, a Paris paper of some pretension, lately gave an illustration of the pneumatic despatch at Sydenham, and in an explanatory article announced that "it goes from the Arsenal to the Crystal Palace, where the Universal Exhibition took place."

ntioned; but these are sufficient to illustrate topographical value of old names.

In the Rue du Château, close to the cathedral, ed and died Lesage, and the house is indicated a neat marble tablet over the door, upon ich is written, in gold letters, "Ici est mort uteur de Gil Blas, en 1747." Nothing could more simple or appropriate than this inscrip-n, which was placed by the Société Agricole Boulogne, and recals, by the omission of sage's name, an observation of Thackeray's, ade, I think, at the Literary Fund dinner, me years ago, that "Gil Blas is as real and as od a man as the Duke of Lerma; and, I be-ve," continued he, "a good deal more so." I mmend this tablet to the attention of Mr. owper and those gentlemen who fear that the loption of a similar method of recording where r distinguished men lived and died would preciate the value of house property. In this stance the memorial positively embellishes d makes interesting an otherwise common-ace house, and I do not know why the same sult may not be obtained in England. In the ne St. Jean, in the upper town, not far from e Rue du Château, died Thomas Campbell. Is ere no English club or association who will do r the author of "The Battle of the Baltic" hat the Société Agricole has done so grace-lly for the author of "Gil Blas"? Churchill, e poet and satirist, died at Boulogne,—it is id in the Rue Neuve Chaussée,—but the house not known. JOHN HEBB.

CONTINENTAL NEWS.

The Rhine.—The Queen of Prussia has caused monument to be erected at Coblentz, to com-emorate the opening of the great railway ridge which now connects that city with all the hief lines east of the Rhine. It consists of a linth column, 28 ft. high, resting on a base omposed of two steps. The Prussian eagle urmounts the capital, and the plinth bears an nscription descriptive of the circumstances in-ended to be commemorated.——The beautiful uins of the old castle of Godesberg, which will be emembered by all our Rhine-travelled readers s coming immediately after Bonn on the up-ard journey, is about to be taken down, having een sold by public auction on the 11th October, ogether with about fifty acres of the surround-ng land. What a pity!——Thomas à Kempis s about to have a monument erected to his emory, at Kempen, his native place. Kempen s a small town near Dusseldorf, on the road to Cleves. The Queen of Prussia, on passing hrough the town, on her late trip to Cleves, ook the opportunity, on being presented with a opy of Thomas à Kempis's works, to place a um at the disposal of the burgomaster for this urpose.——Professor Steinle has painted a arge picture, to be placed over the altar at the Church of the Minorites at Cologne, which we mentioned as undergoing thorough restoration. The picture will cost 6,000 thalers, of which one-hird has been voted by the Rhenish Art Union.

Hamburg.—A large lunatic asylum, the first stone of which was laid in December, 1861, has ust been completed. The buildings are in detached groups, the principal one consisting of a hospital, having a frontage (towards the south) of 580 feet, and two wings at right angles, each 250 feet long. Some 30 yards distant is another building 500 ft. long, forming the fourth side of the square at the back of south elevation. This building is fitted up with cells for the reception of noisy or violent patients, and will have the floors and walls lined with an elastic preparation composed of India rubber and cork shavings. A third group consists of what is called the Boarding House, designed to receive such patients as have the means to secure superior comforts and accommodation, paying from 5*l.* to 10*l.* per month. Smaller detached buildings, as the chief physician's residence, lodges, stabling, and coach-houses, complete the establishment, which has been fitted up throughout with all the improvements and conveniences of the day. Messrs. Timmermann & Schrader were the architects.——The tower of the church of St. Nicholas, which was built from the designs of Mr. G. G. Scott, is advancing towards completion. The funds have, however, suffered considerably, now that the church itself is finished, and hence the progress made is but a slow one. The tower and spire will be 452 ft. high. A very handsome stone pulpit has lately been placed in the church, chiefly executed in England.——A society has just been formed for the purpose of erecting cheap working-men's dwellings, a step likely to be productive of much good, and one which will soon be imitated in other overcrowded German cities.

Italy.—The church of Santa Maria del Fiore at Florence is about to have a façade. The committee is engaged in considering the designs which have been received in competition, and which are now publicly exhibited.——A soldier, whilst bird-nesting among the ruins of the old monastery of the Fratelli Umiliati at Pistoja, was fortunate enough to discover a large silver goblet, richly chased and ornamented with figures in relievo. Connoisseurs of course declare it to be the work of Benvenuto Cellini.

BRISTOL SOCIETY OF ARCHITECTS.

THE students' classes for Session 1864-65, have been formed in conformity with a resolution adopted at the council meeting of July 4th, 1864, for the purpose of helping the students to acquire a greater knowledge of their art than can be obtained in the routine of the various offices in which they are engaged; but any or all of the classes are open to other members of the society. The course of study is to be progressive, and is intended to be preparatory to the examinations established by the Royal Institute of British Architects. It may be comprised under the following sections:—

1. The History of Architecture and the Subsidiary Arts.
2. Drawing (A), from the Greek Antique and the best works of the Middle Ages.
   Drawing (B), from the Life, with Anatomical Lectures.
   Drawing (C), Figure Composition.
   Drawing and Modelling (D), Painting in Tempera.
3. Design—the Science of Construction and applied Mathematics, including Art Processes.
4. Languages, applied to the Study of Architecture.

No student will be permitted to draw from the life, until the examiners are satisfied with the progress he has made in drawing from the round. The fee for each student or other member for the course will be half-a-guinea, to be paid on entering his name. The classes were to commence on November 9th, and various lectures have been arranged for.

THE INDUSTRIAL EXHIBITION AT THE AGRICULTURAL HALL.

THIS exhibition terminated on Monday, on which occasion the Chancellor of the Exchequer presided. The honorary secretary, at the closing meeting, read a statement detailing the statistics and success of the Exhibition. During the eighteen days and evenings on which it had been open 196,926 persons visited the hall. It was the intention of the committee to award prizes, 81 of the first-class, 76 of the second, and 179 of the third; besides ten special prizes. The prizes would be in the form of a certificate in the Renaissance style of Italian art. It was arranged that each certificate should be signed by Earl Russell, who opened the Exhibition, and by the Chancellor of the Exchequer, who was then closing it, and by the Earl of Shaftesbury. The presentation would take place in January next, and most probably in Exeter Hall, on which occasion the Earl of Shaftesbury would preside. Mr. Gladstone, at the conclusion of his speech, said:—"The example you have set has already led to such results that I could give you a list of towns and places in which it is contemplated to hold similar exhibitions. Let us not, therefore, in speaking of this Exhibition as having reached its natural termination in the sense that the doors of the hall will be closed—let us not forget that it still possesses its moral force and social promise. Let us hope that it will be the happy parent of many children, and that it will help to confirm in the minds of the labouring community the useful lessons they have already learned, and will likewise prove to be the effective means for leading them onwards in the path, not of illusory and unsubstantial, but of true and real progress, and of healthful and Christian civilization." The committee, we learn, will relieve those noblemen and gentlemen who put down their names for various amounts as a guarantee fund of liability, and will have a surplus which will render such fund unnecessary on any future occasion. Next year they will be able to offer better prizes and other inducements to the development of the talent and industry of the working classes, and will extend the exhibition to the artisans of the whole metropolis; and thus, it is expected, fill the galleries as well as the basement of the Agricultural Hall with useful and valuable novel productions.

CATHEDRALS AND CHURCHES.

MR. J. HARRIS writes from *St. Alban's*,—Seeing the number of statements afloat with regard to the length of the various cathedrals, I have made this church my study, believing that our venerable pile exceeded them all in length. Chauncy, Clutterbuck, and Carter give it as 600 ft.; Buckler gives it 556 ft., and it is so stated in a guide published by Mr. Langley, of High-street. I have measured the same, and the extreme length from the westernmost point of the buttresses of the great west porch to the easternmost point of the buttresses of the lady chapel, I find to be exactly 556 ft. I think the following table will be found pretty accurate:—St. Alban's, 556 ft.; Winchester, 553 ft.; Ely, 532 ft.; York, 520 ft.; Westminster, 511 ft.

Mr. C. J. Palmer has said as to *St. Nicholas', Yarmouth*,—This church measures from east to west 230 ft., and in width, exclusive of the transepts, 110 ft. It is wider than any English cathedral church,—York being in width, 104 ft.; St. Paul's, 102 ft.; Norwich, 97 ft.; Winchester, 86 ft.; Durham, 81 ft.; Lincoln, 80 ft.; and Ely, Peterborough, and Salisbury, 78 ft. The width of St. Michael's, Coventry, with its spacious double aisles, is, I believe, 104 ft.

"Clericus" says the dimensions of the purely parochial church of *Holy Trinity, in Hull*, as stated in Sheahan's "History of Hull," just published, are as follow:—

"The edifice is 272 ft., long from east to west, the length of the nave being 144 ft. The breadth of the nave of the transept under the tower is 28 ft.; the length of the choir, 100 ft.; the breadth of the nave of the church is 172 ft.; the length of the transept, 96 ft.; and the breadth of the choir, 70 ft. It covers an area of about 25,640 superficial feet.

Of *Tewkesbury Abbey Church*, an inhabitant writes,—The dimensions of Tewkesbury Abbey, in particular as respects its length, will not very frequently be equalled, I think. They are thus given in "Bennett's History of Tewkesbury:"—Length from east to west (inside building), 317 ft. 2 in.; length of transept, north to south, 122 ft.; breadth of nave, 71 ft.; height of west window, Norman arch, 65 ft. It is stated that before the demolition of the lady chapel the building was at least 100 ft. longer.

ARCHÆOLOGICAL INSTITUTE.

ON the 4th, the first meeting for the season of the members of the Archæological Institute was held, the Marquis Camden in the chair. Numbers of objects of archæological interest were displayed on the table.

The Marquis Camden, in opening the proceedings of the meeting, congratulated the members on having been honoured with the patronage of the Prince of Wales, and on the success of their last annual congress at Warwick.

Dr. Rock noticed with regret the loss of Mr. Winston, and attributed his lamented death partly to the excitement of attending the congress at Warwick.

The first papers read were communications from Mr. H. Ross, in reference to excavations recently made on the supposed site of the Roman Vagniacæ, with notes by Mr. Purnell on "Othona." There appears to be some uncertainty respecting the date and the uses of the principal building yet discovered on the supposed Roman site, and whether it was, in fact, erected by the Romans, though the remains of walls in the neighbourhood contained numerous Roman tiles. It was not clear whether the building was intended for a beacon or a church, or was merely a barn.

A communication was read from Mr. Albert Way and Mr. G. Scharf on some paintings from Amberley Castle, near Arundel, mentioned in our last, of the time of the Emperor Maximilian, three of which were exhibited. They represented the figures of three females clad in male armour, and decorated with emblematical devices. The paintings were on oak; and a discussion ensued as to the name of the artist by whom they were painted, the authors of the paper having attributed them to Theodor Bernardi.

DECAY OF WOOD CARVINGS.

THE "Report of the Commission appointed to inquire into the causes of decay in wood carvings and the means of preventing and remedying the effects of such decay" has been printed for the use of the Department of Science and Art, who appointed the Commission with the view of preserving the valuable decorative examples belonging to the public, and now in the South Kensington Museum.

The conclusions arrived at by the reporters,—Messrs. T. Graham, J. O. Westwood, W. G. Rogers, P. Graham, J. C. Robinson, J. Webb, J. G. Crace, and G. Wallis, are as follows:—

"1. That the action of the worm may be arrested and the worm itself destroyed by vaporisation, more especially by the vapour of benzine, as appears from the experiments reported, and also from the successful results arrived at in the Bodleian Library, at Oxford, in the destruction of the book-worm.

It will be advisable to have a room sufficiently large to take in any piece of carved work or furniture which may be required by the Museum and which may show symptoms of decay. This room should be so constructed that it can be closed and made as perfectly air-tight as possible, but with means of renewing the benzine placed in saucers from time to time as it evaporates, without opening the ordinary means of access or entering the chamber; as also of ready ventilation after the objects are considered to have been sufficiently treated and before any person enters the room for the purpose of removing them.

The process must always be carried out during the spring and early summer months, according to the state of the temperature and the observations of those in charge of the carved work, as to the action of the worm, which is manifested by the fine dust falling from the worm-holes, crevices, &c.

II. That the practicability of complete restoration of carved work is fully shown in the results of Mr. Rogers's labours at Belton, as detailed. The important question, however, as to the restoration of gilded carved work, and of panels on which pictures have been painted and which have been attacked by the worm, presents difficulties which, at present, there seems to be no means of overcoming, as in neither case could the objects be immersed in water or submitted to the action of gelatine. That the worm could be destroyed by vaporisation, as in all other cases, appears certain, and there is no reason to suppose that the vapour of the benzine would influence either the gilding of the one or the colours of the other, especially if applied in the latter case to the back of the picture.

III. That after the worm has been destroyed by the course of action proposed, further attacks from it can be prevented by treating the carved work with a solution of corrosive sublimate (chloride of mercury) either in methylated spirits of wine, or parchment size, according to the surface character of the carving or wood-work; the strength of the solution in each case being, as before stated, sixty grains of the chloride of mercury to a pint of fluid, whether spirits of wine or parchment size.

Before concluding this report, we beg to recommend that as there is some uncertainty as to the fact whether *all* the ova of the beetle deposited in one year become developed to the worm state in the next, it is desirable that the two cases in which the experiments tried by the secretary, Mr. George Wallis, during the spring and early summer months of 1863, should be kept with the specimens, intact, until after Midsummer, 1864, in order that Mr. Wallis may observe whether any worms or beetles make their appearance during the ensuing season. This is specially desirable in the case treated with benzine."

In respect to these cases, Mr. Wallis adds a memorandum, in which he says:—

"It would appear that the ova deposited previous to the objects being subjected to the action of chloroform or benzine were not *all* developed in 1863, the season in which the experiments were made; and that in any future action based on the experiments reported, this fact should be taken into account, and the vaporisation repeated more frequently than would otherwise have been necessary if all the ova of one year were developed and came to maturity in the next."

A report to the Commission itself, by Mr. Westwood, their colleague, who is Hope professor of Zoology at Oxford, says:—

"The insects which in this country are found to be the most injurious from their habit of burrowing into the wood of furniture, belong to three species of beetles of small size and cylindrical in form (the better to enable them to work their way through the burrows in the wood) belonging to the family *Ptinidæ*, and known under the systematic names of *Ptilinus pectinicornis*, *Anobium striatum*, and *Anobium tessellatum*.

* * * *

I have had the deal flooring of an underground room destroyed by the *Anobium striatum*, and they are also equally destructive to beams and rafters of houses, churches, &c., making their entrance at the ends if the beams have been varnished (which of course teaches us that the ends of the beams should be rendered obnoxious to them by coats of paint or saturation). In the perfect state, the insects of the genus *Anobium* are well known under the name of the "death watch," as these insects produce the ticking noise occasionally heard in old houses. It is also the *Anobium striatum* which is so injurious in libraries; the grub burrowing through entire volumes, and feeding upon the paper, and especially the *pasted* backs of the books.

The destruction of these insects, when inclosed in articles of furniture, is by no means easy, although with care, much mischief might be prevented. The saturation of the wood with some obnoxious fluid previous to its being used up in the manufacture of objects of value would, I should think, be beneficial. When manufactured, of course the size of the object affords a greater or less degree of facility in operations for the destruction of the grub.

In the cases of articles where many smaller pieces of wood are joined together saturation would be dangerous, as would also the placing of small objects in tin boxes and subjecting them to heat by plunging the tin case into boiling water (a practice which we employ to destroy the grubs which get into our insect boxes).

Various infusions have been used for saturation, amongst which creosote appears to be the most effective. It has, in fact, been found that the woodwork of the jetties at Plymouth saturated with creosote have resisted the action of the marine insects which have done so much damage to the wooden marine erections all round the coast.

A strong infusion of colocynth and quassia, spirits of turpentine, expressed juice of green walnuts, and pyroligneous acid, have all been proposed. In hot climates the ravages of the *Anobium* on books has been prevented by washing their backs with a fluid compound of corrosive sublimate (ten grains) and four ounces of alcohol, and the paste used in the book-covers is there also mixed with alcohol.

Herr Temmnick preserved his books from the *Anobium* by dipping them in a solution of quassia. Except on a small scale, however, the saturation of furniture seems scarcely practicable. Fumigation seems, however, to be more available. For small objects I know no better plan to destroy the *Anobium* than that which has been adopted successfully at the Bodleian Library, on my recommendation, against the book-worm, namely, to inclose a number of volumes in a box, shutting quite close, and placing a small quantity of benzine in a saucer at the bottom of the case. The same plan might be adopted with small ornamental woodworks, inclosing them in glass cases shut as nearly air-tight as possible. This plan, in fact, seems to me the most efficacious, and answers one of the special questions submitted to the Commission."

On the subject of restoration, according to the report of the Commission, some facts communicated by Mr. W. G. Rogers are the most important, and may be considered as decisive as to the practicability of restoring the most delicate works to as nearly as possible their original condition, and even by this restoration rendering them proof against the attack of the larvæ in future.

"In 1855 the carvings by Grinling Gibbons, at Belton House, were in such a condition as to render it absolutely necessary that something should be done to prevent their complete destruction. To this end, they were placed in the hands of Mr. Rogers, who undertook to experiment upon their restoration. This gentleman reports that the first step he took was to have the various pieces photographed, as a means of recording the position of each detail of the ornamentation, &c. The whole of the works were in a serious state of decay, portions being completely honeycombed by the worm. In order to destroy or prevent any future development of the insect within the wood, Mr. Rogers caused the whole to be saturated with a strong solution of corrosive sublimate (chloride of mercury) in water. The colour of the wood, however, suffered so seriously by the action of the mercury, that it was found necessary to adopt some means of restoring the original tint. This was effected by ammonia in the first instance, and subsequently by a slight treatment with muriatic acid. After this, the interior of the wood was injected with vegetable gum and gelatine, in order to fill up the worm-holes and strengthen the fabric of the carvings. A varnish of resin, dissolved in spirits of wine, was afterwards spread on the surface, and then the dismembered pieces were put together in conformity with the photographs taken, as records, prior to the work of restoration having been commenced.

In order to ascertain the present condition of these carvings seven years after the operations detailed had been completed, Mr. Rogers, at the request of the Commission, communicated with the Hon. Edward Cust, one of the trustees of the Earl Brownlow, who desired him to communicate with the clerk of the works at Belton, Mr. G. A. Lowe."

In Mr. Lowe's reply, he says,—"I am glad to inform you there is never any appearance of worm dust from the very beautiful carving by Gibbons since you preserved it some years back."

THE NEW PIER FOR WESTON-SUPER-MARE.

A COMPANY was lately started with the view of constructing a pier, the capital being 20,000*l.* in 2,000 shares of 10*l.* each. The site fixed upon is opposite the island of Bernbeck, the northern point of the bay on which the town is situate, the object being to connect the island with the main land. The pier will start from the main land from a stone abutment. On that will be placed stone buildings, which will be used as toll-houses, between which will be entrance-gates in style with the structure. The main body of the pier, which will be 1,000 ft. in length, and in width 20 ft., will rest on wrought-iron columns, and the roadway will be of wood, covered with asphalte. On either side of that a continuous line of seats will form an agreeable lounge for visitors. On the island of Bernbeck, which will form the head of the pier, it is proposed to construct some abutments and ornamental towers, to correspond with those at the opposite end, and the island itself will be laid out in esplanades, pavilions, refreshment-rooms, &c. A stand will be provided for a band. At the further extremity of the island a breakwater will be formed, with pier, so as to afford shelter for steamers and yachts at all states of tide and in fine weather. The engineer of the undertaking is Mr. E. Birch, C.E., of London; and the contractor is Mr. D. Climie, of Shrewsbury. Almost the whole of the ironwork is ready for fixing. The foundation-stone has just been laid, the occasion being observed as a holiday, with procession, bell-ringing, &c.

VALUE OF LAND IN THE ISLE OF WIGHT.

COMPENSATION CASE.

AT the end of last month a jury assembled at the George Inn, Yarmouth, for the purpose of deciding on the value of certain land, the property of Mr. Benjamin Cotton, of Afton House, of which the Government has taken possession, for the purpose of carrying out the contemplated improvements in making roads, &c.; the above gentleman appearing as claimant for a greater sum than had been offered him, and the Secretary at War appearing by his representatives as the respondent.

Mr. H. T. Cole appeared for the claimant, and Mr. Hawkins, Q.C., appeared for the respondent. Mr. Cole, in addressing the jury, said the claim sent in amounted to the sum of 1,928*l.* 17*s.* 6*d.* The land taken by the respondents was 3 acres, 1 rood, and 3 perches, across Afton Down, for which Government offered 70*l.*, but afterwards increased their offer to 100*l.*

Mr. W. T. Stratton, architect, Newport: In 1857, I made Mr. Cotton an offer for about six acres and a half. I offered him 100*l.* a year for six acres and a half, which he refused: he wanted 130*l.*

By the jury: I have had experience in building villas round Ventnor, Bonchurch, &c.; they are built there from 100 ft. to 300 ft. above the level of the sea; at Shanklin, above 300 ft.; at Blackgang, 388 ft.; and at Alum Bay, about 200 ft. I value the land actually taken as building land, at 3*l.* per acre per annum. From A to B on the plan, 1 rood 23 perches, at 1*l.* per annum, agricultural value, at thirty years' purchase, and 25 per cent. on a forced sale, at 15*l.* From B to C the central portion, containing 1 acre, 1 rood, 27 perches, I value as building land at 8*l.* per acre, 26*l.* 1*s.* From C to D, 1 acre, 2 roods, and 9 perches, I value at 1*l.* per acre, and 25 per cent. for a forced sale at 58*l.* 2*s.* 6*d.* The damage by severance of the land between C and D, at 135*l.*; ditto, B and C, 629*l.* 1*s.*; ditto, B to C, 797*l.*, making a total of 1,895*l.* 4*s.* 6*d.*

Mr. F. Newman, architect, Ryde: I valued it as building land at 9*l.* per acre, and damage and compulsory sale included at 1,916*l.* 13*s.*

Mr. J. Jolliffe, a builder: My value is 10*l.* per acre as building land. I pay myself from 20*l.* to 25*l.* per acre in more sheltered places. I have had applications for land at 600 ft. above the sea, and for my farm as a residence for a clergyman, and the house is 300 ft. above the sea, where I can get even the most delicate plants to grow.

Mr. E. C. Robins examined: I am an architect in London, and I have been acquainted with Freshwater for ten years. I visit it every year, and I agree with Mr. Stratton's evidence. I was consulted in 1860, and I then recommended that a portion of this land should be laid out for building purposes; but I consider that the road would do considerable damage to the Down as building land.

Other evidence on the part of the claimant having been given,—

Mr. F. J. Clarke was examined, on the part of the Secretary-at-War: I am the senior member of Farebrother, Clarke, & Lye, of London. The land in question is *not* building land, and as Down land I value it at 3*s.* an acre, its agricultural value, or 12*l.* fee simple. The land taken is 3 acres, 1 rood, which, at 25 years' purchase, I value at 39*l.*, and 20 per cent. for compulsory sale, 8*l.*, making a total of 47*l.* I have frequently had to sell land of a similar description, and in my judgment I can't see that any injury will be done to it by this military road, and as it is to be an open road, there can be no appreciable damage done.

Mr. Oakley, of the firm of Smith, Son, & Oakley: I valued the land taken away for the road at 8*s.* per acre per annum. There were about 12 acres severed from the rest; and although there was no fence, no injury could arise to the sheep, because they could run across the road, and the farm would let for just as much as it did now, if 15 acres of it were taken off, and the road made.

Mr. C. Lee, London: I value this as very good Down land, at 10*s.* per acre, taken at thirty years' purchase, with 20 per cent. for compulsory sale, at 54*l.* 15*s.* It is not eligible for building purposes, being too much exposed.

Mr. H. Hunt, architect: I shall confine my evidence to this land being building land; and I don't think it is, or every piece of land which you may get access to may be considered as building land, and there is not such a demand for houses here as to justify persons in speculating in this exposed place.

Mr. John Clutton, surveyor to the Commissioners of Woods and Forests: I am also a farmer, and well acquainted with the value of land in the island. I should put the value of the land taken for this military road at 6*s.* or 8*s.* per acre for the whole, but as a strip, I should say 10*s.* per acre, at thirty years' purchase. The road adds to the value of the property. The land has no building value whatever.

Mr. Hawkins addressed the jury at very great length, and contended that Mr. Cotton would be amply compensated if the jury awarded him 30*l.*

The jury, after deliberating amongst themselves for about an hour returned a verdict, awarding the claimant the sum of 61*l.* 5*s.*, with a note as to certain fencing to be appended as part of the arrangement.

The amount awarded, it will be seen, was *twelve times* the sum named by the Government surveyors, though not quite *one-third* of the sum asked for the claimant.

As to the actual value of land at Freshwater, an architect gives us the following facts:—In the spring of the present year, he obtained an offer of 12,000*l.* for 80 acres,—50 of these being close down land in question, and about 30 moorland: at the rate, therefore, of 150*l.* per acre for this large area. This offer was declined, 200*l.*

er acre being required. Shortly after he received an offer of 8,000*l.* for 40 acres, being the wer half of Afton Down. This offer was likerise declined,—250*l.* per acre being required,—t which rate he is now negotiating the sale. t appears that levels have recently been taken r a line of railway, part of which will unite armouth with Freshwater.

ARCHITECTS' CLAIMS.

THE case of Foggett *v.* Harrison was recently tried at he County Court, Preston. This was a claim for 50*l.* by he plaintiff, an architect, of Blackburn, for the preparaion of plans, specifications, &c., for the erection of three emi-detached villa residences, at East Cliff, Preston. It ppeared that an advertisement was inserted in the *Guardian* of October 17th, 1863, by the defendant, Mr. Harrison, solicitor, for competitive designs for the buildngs named; and the plaintiff, among others, supplied esigns, which were accepted. Upon those designs he was nstructed to prepare plans, &c., with a slight alteration, n order to reduce the cost to 2,000*l.* The plans, specifica ions, &c., were made and sent in, and tenders advertised or upon them. Mr. William Fye, builder, of Preston, as the successful competitor, his tender being 1,897*l.* 10*s.* The plans, &c., were subsequently still further altered, at defendant's request, to reduce the cost. During this time negotiations had been going on between the plaintiff and defendant as to the best means of defendant raising the money by a loan for the erection of the houses, and the result was some delay, and ultimate failure to procure the money. On the 25th of May, defendant wrote plaintiff stating that he had let the land to Mr. Fye; that plaintiff was to send his charge in; and to be as reasonable as possible. Subsequently plaintiff sent in his account, amounting to 65*l.* Defendant objected to it as being too much, and ultimately plaintiff, who showed defendant that he was entitled to 83*l.*, reduced his claim to the amount now sued for, and on being refused payment commenced the present action.

For the plaintiff the evidence of Mr. Pownall, architect, Preston, one of the competitors, was to the effect that the competition, if such it could be called, was decided before defendant saw witness's plans, though there was no time fixed for the plans to be sent in; that he had examined the plans and specifications in question, and had carefully noted the evidence given by Mr. Foggett, and was of opinion that the sum first charged was only a reasonable remuneration. He considered plaintiff entitled to payment for making the second set of plans and specifications. Altogether, he considered Mr. Foggett entitled to 65*l.*: he would not have done the work for less. The work done by Mr. Foggett would take him more than a month, single-handed. Witness was asked whether he had known instances of as great disparity in tenders as in the case before them, the highest being 2,500*l.*, and the lowest 1,900*l.*, and replied that he had. Witness was also examined as to the correctness of the plans, but said he was unable to give a correct answer without an examination of the specifications.

Mr. William Pye said he was a builder, residing in Preston, and sent in a tender for the buildings alluded to, which was accepted. He corroborated Mr. Pownall's remarks as to the great disparity which occasionally occurred in tenders. He saw the plans and specifications in question at Mr. Harrison's offices, and never saw a better set, and heard other builders say so too. He did not go on with the work; but took the land at a rent from Mr. Harrison. Five per cent. was the customary charge when the works were carried out, and 2½ per cent. if not carried out; and supposing the detailed drawings were made after the contracts were accepted, and the works not carried out, he should consider the architect entitled to the full per-centage.

For the defendant it was urged that if the plans had been valuable for the purpose intended, 25*l.* would have been ample remuneration; but the plans were utterly unserviceable: no person could carry them out, and therefore plaintiff was entitled to no remuneration for them. Five out of the six tenders were at least 500*l.* over 2,000*l.* The defendant, being convinced that the work could not have been done for the sum represented by Mr. Foggett by any competent person, abandoned the idea. It was quite true Mr. Fye had come within the mark; but, supposing Mr. Fye competent to carry the work out, Mr. Veevers would tell his Honour that it could not possibly be done by those plans.

The defendant, in his evidence, admitted that it was in consequence of his inability to negotiate the loan upon favourable terms that he let the land to Mr. Fye. Before this he had not made any complaint respecting Mr. Foggett's plans. Mr. Richard Veevers, land surveyor and architect, said he had had considerable experience in building. He had examined the plans and specifications before the court, and supposing them to be unobjectionable, 25*l.* would very well pay for them. He did not think the plans were perfect. In the event of the works being begun from them, it would be found when they got to the top of the first floor that it would be impracticable to get any further; there would not be 3 feet from the landing to the ceiling. Mr. Veevers then pointed out several defects, and said the design was nothing but an elegant picture: the plans might have cost some thousands of pounds as extras had they been worked upon. They had not been properly considered. Had made many plans for the erection of dwelling-houses. Did not think Mr. Foggett was entitled to the per-centage he claims; nor was it the custom, although he himself had got 2½ per cent. in similar cases. He did not think Mr. Foggett could explain how the defects named could be met. It would be utterly impossible to carry the works out upon these plans. It was possible for the contractors not to have noticed the defects. If the plans were workable five per cent. would be a fair remuneration. He would not divide the five per cent.

Other evidence was led on either side, and Mr. Hulton, the judge, gave the following decision:—"I have read the correspondence between the parties, and after carefully considering the case, I direct a verdict to be entered for the plaintiff for the sum of 50*l.* The terms on which the plaintiff worked were ascertained, and Mr. Harrison accepted the plans and estimates which were furnished by the plaintiff. The contract with the builder was put an end to by Mr. Harrison on grounds entirely unconnected with the present action; and the defendant afterwards, by his letter of the 25th of May last, strongly and clearly acknowledged his liability to compensate Mr. Foggett. This liability was, however, repudiated by Mr. Harrison at the hearing, when he defended the action on the ground that the work and labour of the plaintiff is entirely valueless. That defence having failed, the only question that remains to be considered is the amount of remuneration to which the plaintiff is entitled; and considering the labour bestowed by the plaintiff not generally connected with the profession of an architect, and the per centage agreed upon, I think the plaintiff is entitled to the sum I have named."

COMPENSATION CASES.

Compensation by Railway Company to Leaseholder.—The case, Healey *v.* The Thames Valley Railway Company, in the Court of Queen's Bench, raised rather an important question of general application as to the proceedings for compensation against public companies, and especially as to the notice to be given by the claimant. The notice given by the claimant, the company having taken his lands, ran thus:—"The said lands, &c., are held by me on lease, and are used partly as and for private grounds and partly for farming and agricultural purposes; and I claim 1,030*l.* as and for the value of my estate and interest in the lands, and as compensation for the damage that has been and will be sustained by me by reason of the lands being compulsorily taken, and by reason of the injuriously affecting the lands adjoining." The question was whether this was a sufficient notice within the Act. The company made no offer upon it, and did not take proceedings to settle the compensation. Upon that the claimant brought his action to recover the full amount of his claim, 1,030*l.*; and at the trial it appeared that though he held under a lease for years, he had only about a year unexpired. Upon this it was objected that the proper procedure would have been before magistrates, and that the company had been misled by the notice, and that it was not sufficient, as it did not state the nature of the claimant's interest. The plaintiff recovered subject to this question. After some procedure on the question the court gave a rule absolute to set aside the verdict.

Messrs. Routledge v. The London, Chatham, and Dover Railway.—In the Lord Mayor's Court, before Mr. Commissioner Kerr. The claimants in this case were the well-known publishing firm, whose premises in Farringdon-street have been taken for the purposes of the London, Chatham, and Dover Railway.

The jury having viewed the premises,

The counsel and parties on each side were engaged in consultation for a considerable period, the result of which was, that a verdict was agreed to by consent for 7,500*l.*, to carry interest from the date of the bond.

ACCIDENTS.

A FLOOR of a publichouse, in Weaver-square, Leeds, has fallen into the ground-floor. One person was severely injured. The floor on a previous occasion had to be supported while it was occupied by a dancing party; but in the present case only three persons were on the floor.

A chimney-stack, recently erected at the chemical works of Messrs. Allhusen & Co. (the Tyne Chemical Works), at Gateshead, fell recently, but without injury to anybody. The chimney was partly erected about twelve months since, when it was left to settle, so as to gain solidity and strength, and when it was thought the structure was sufficiently firm the builders began to complete it. Its height was 240 ft. The builders finished the whole height about three weeks ago; then it began to show signs of weakness; and, from the force of the wind, perhaps, leaned considerably from the perpendicular. The workmen were ordered to raise a scaffold on the inside, that it might be taken down: a railing was placed around it; and the road which passes by was stopped, to preclude any possibility of a mishap. The workmen had barely reached the top of the scaffolding, when they became alarmed and left the place; and soon after the upper half of the chimney, or about 100 ft., fell into the road. The recent heavy rains are blamed for keeping soft the mortar or cement used in the erection.

The roof of a dwelling in North Shields has fallen in, destroying furniture, but not injuring any one. The wood was quite rotten.

At Perth, about two-thirds of the new-built chimney-stalk, in connexion with the works of Messrs. Puller & Son, Mill-street, have fallen. Fortunately no one was injured by the falling bricks, most of the employés having left the work. The stalk, which was 160 ft. high, was just about finished, when it was observed to begin to swing, and Messrs. Puller gave orders to have it taken down: the workmen had been several hours engaged in undoing the work, and had only left for a short time, when the fall took place.

OPENING OF THE RIPLEY HOSPITAL, LANCASTER.

THE new Ripley Hospital, for the endowment of which the sum of 100,000*l.* has been given by Mrs. Ripley, in pursuance of the wish of her late husband, has been opened with fitting ceremonial observances.

The hospital has been erected on a plot of ground adjoining the London and North-Western Railway, in the southern suburb of the town, and near Springfield Hall, which has recently been purchased by Mrs. Ripley, who intends residing there. The foundation stone was laid on the 14th of July, 1856, with great ceremony. The edifice is now complete, and has cost between 30,000*l.* and 40,000*l.* The building has been erected from designs by Mr. John Cunningham, of Liverpool, architect: the contractor, Mr. C. Blades, of Lancaster. The hospital is intended for the education, industrial training, and entire support of orphans and destitute children who are born in the county, or about Liverpool. The inmates will be subjected to industrial training. The children will be uniformly clothed; the boys in dark brown. There are now 47 inmates, and that number will be gradually increased until it may reach 300 in all. The building is in the Pointed style.

THE BUILDING TRADES.

Bradford.—The journeymen plasterers in this town have struck work. Contrary to terms of their own, subsequent to an advance of wages in April last, the men, without previous notice, insist on the interval which may occur between dark and five o'clock, during the winter months, being paid as overtime, and refuse to work by candlelight unless the time after dark is so paid.

Carlisle.—The following notice has been sent to the local Board of Health by the masons of this city:—

"Committee Room, Gleaner Inn,
Oct. 27, 1864.

To the Master Builders of Carlisle.

Sir,—We, the operative masons of Carlisle, have unanimously agreed that our winter working rules be as follows:—That our wages be 24*s.* per week from Nov. 11, 1864, until March 1st, 1865; Monday, Tuesday, Wednesday, Thursday, Friday, at 4*s.* 4*d.* per day, and Saturday 2*s.* 8*d.*; total, 1*l.* 4*s.* Quarter time to be half-past nine o'clock for Monday, Tuesday, Wednesday, Thursday, and Friday; and quarter time for Saturday at half-past eight o'clock. Breakfast to commence Feb. 2nd, 1865."

The Board considered that there were generally two parties to an agreement, but in this case the masons had stipulated their own terms. As the document was not signed, the subject was left in the hands of the surveyor, who would be guided by the other masters in the town.

Galashiels.—The contractor for making the Galashiels and Innerleithin railway tried a dangerous experiment the other night. He proposed a reduction of wages to three hundred navvies, who were standing round the door of his lone pay-office, about two miles from Galashiels. Of course the pay-office was demolished at once; and, but for prompt concessions, there is little doubt that the contractor would have been demolished also. As it was, the indignant navvies trooped into Galashiels, where, being interfered with by the police in the riotous celebration of their triumph, they pulled down the station-house, and nearly killed two constables.

Wurtemberg.—The Workmen's Associations in Wurtemberg have presented a petition to the Chamber of Deputies for the abolition of the law which forbids artisans to marry without first obtaining the consent of the police and of the Administration.

CHURCH-BUILDING NEWS.

Middleton Cheney (near Banbury).—The work of restoration is going on at this church, under the direction of Mr. G. G. Scott, architect. The interior has been cleared of its many obstructions. The walls have been cleaned down, and many coats of whitewash removed, and the natural surface of the stone exposed to view. The pillars and arches of the nave arcade are found to be very much mutilated, and require careful restoration. The chancel arch was found to be in a very bad state, and supported by pieces of timber from the top of the old oak screen. This has been entirely removed; the arch taken out and rebuilt; and the screen is to be restored. There is also to be a new screen dividing the chancel from the aisle (south side), in front of which the new oak stalls are to be placed. The fine old east window is to be filled

in with stained glass, supplied by Messrs. Morris, Marshall, & Faulkner, of London, in memory of the late Mr. William Crombe, of Banbury, and presented by his widow; also the south window of chancel, in memory of the late Archdeacon Churton, formerly rector of this parish, and author of the "Lives of the Founders of Brazen-nose College." The chancel floor is to be laid with encaustic tiles, the nave with Hornton stone, in 18 in. squares. The floors will be lowered to their original level. The oak roofs which were found to be very defective, have been taken off, except the tie-beams of nave, which have been spliced and strengthened, and such of the timbers as were good have been re-used, and the old colouring and paintings preserved. The roofs are to be covered with lead, externally. The walls have been underpinned, and the base courses and buttresses made secure. A new drain has been laid all round the building. The walls will be restored and repointed. The north and south aisle windows are being restored. It was found that the tracery in most of the windows had been removed, and it is now being replaced in its original form. The east wall of the south aisle has been rebuilt, and the window made perfect. The pinnacles and parapets of the tower are to be taken down and rebuilt, and the gutters reformed. A new lightening conductor is also to be fixed. The cost is estimated at about 2,000*l*. Messrs. Davis, of Banbury, are the contractors, and Mr. H. Roome, clerk of the works.

Bangor.—The new church at Bangor has been consecrated and opened. The church occupies a site to the eastward of the road leading from near the cathedral to Garth Ferry. The building consists of a nave, with north and south aisles, chancel, south porch in the second bay from the west end, a small turret spire at the east end of the south aisle, and a vestry in the same relative position to the north aisle. The lower story of the turret forms a porch at the east end of the nave, and a north doorway corresponds with that of the south porch. The vestry has a separate external entrance, and opens internally into the chancel. The style adopted by the architect, Mr. H. P. Horner, of Liverpool, is a plain type of the Early Decorated. The materials used are, externally, the hard dark grey whinstone of the local quarries for walling, and light grey Anglesea limestone, from the Penmon quarries, held by the contractor, Mr. W. T. Rogers, for dressings. The general thickness of the plain walling, without the plaster, is 2 ft. 6 in., and of the turret-wall, 3 ft. The visible stonework, internally, is of Bath stone, from Corsham Down. The bearing-timbers and finished woodwork are of Baltic fir, oak being used for the communion railing, and other more important parts. The plain walling internally is plastered in stucco of a grey tint, without jointing, forming a slight contrast in colour with the Bath stone and the timbers. The nave comprises six bays, opening to the aisles by twelve arches, each 12 ft. 7½ in. span, 8 ft. to the springing, and 17 ft. to the crown. It is lighted at the west end by a five-light window, with traceried head (10 ft. in width, and 17 ft. in height of opening), and by a series of clerestory trefoil lights, eighteen on each side grouped in threes over each arch of the nave. There is also a quatrefoil gable light over the large west window. The roof is of open framed timber of simple carpentry, and is ceiled in plaster between the rafters. There are five windows of three lights each, with pointed segmental heads, in the side-walls of each aisle; and one three-light window, with equilateral arch-head, at the west end of each; and the north aisle has also light introduced by foliated piercings over the doorway on that side. The whole of these windows have simple geometrical tracery of somewhat varied form and their openings to the interior are splayed, and have pointed segmental covering arches. The chancel opens from the nave by a moulded arch, springing from shafted piers, with foliated capitals, the arch being in width between the piers 15 ft. 8 in.; in height, from the nave-floor to the spring, 10 ft. 6 in.; and to the crown, 22 ft. 2 in. The chancel, 25 ft. in length, has its floor raised two steps above that of the nave, and another step forms the kneeling space of the communion-rail. The east window, given by the Rev. E. Pughe, late vicar of Bangor, is of four lights, with tracery head, and is filled with a design on stained glass, from the establishment of Messrs. Forrest & Co., of Liverpool. There is a trefoil gable light over it, also in stained glass. The turret is of simple square form. It passes from the square shape to that of an unequal-sided octagon, at the belfry story, by angular splays and sets-off, and comprises a ringers' loft and space for a light peal of bells. The spirelet, which is built an octagon on plan, with a convex entasis, and has its angles marked by slightly-relieved ribs, springs from eight gabled slopes over the belfry-lights and the four smaller sides of the octagon below, the latter having acute gables, and the larger sides depressed or broken gables, graduated back to the slope of the spire by a series of sets-off. The external masonry of the church is adapted to the fall of the ground, by "stepping" the base tablets, and dropping the external sills of the windows in the western half of the church, forming blank mullioned recesses under the lights. Buttresses of simple design strengthen the external walls, those of the angles placed diagonally, and a slight degree of decoration is given to those of the chancel and nave west gable, by trefoiled canopies in one stage of each. The number of sittings provided is 680, all free. The principal dimensions of the church are these:—

	Ft.	In.
Extreme length internally	112	11
,, ,, over buttresses externally	124	9
,, width internally	55	0
,, ,, over buttresses externally	66	6
Length of nave internally	85	3
,, chancel, ditto	25	0
Width of nave between piers	21	9
,, aisles, from piers to walls	15	1½
,, chancel	19	6
Height of nave, to wall-plate internally	23	10
,, ,, to ridge ,,	41	0
,, chancel, to wall-plate ,,	17	4
,, ,, ridge ,,	33	0
,, aisles, to wall-plate	11	6
,, ,, lean-to	20	0
,, west gable to top of cross	55	6
,, east gable of chancel to cross	40	6
,, turret, to spring of spire	56	6
,, spirelet to top of cross	97	4

OPERA.

Her Majesty's Theatre.—The new undertaking of Mr. W. H. Harrison was commenced on Tuesday night, to a very full house; Miss Louisa Pyne playing *Margaret*, and Mr. Sims Reeves *Faust*, in Gounod's overpraised opera of that name, with immense and deserved success. The part suits Miss Pyne admirably, and the applause was unanimous. The co-operation of Mr. Sims Reeves is a strong point in favour of the new management. A singer fresh to London, Mr. Garcia, played *Valentine*, and both sang and acted remarkably well. In the "Traviata," produced on Wednesday, for the *début* of Madame Kenneth, Mr. Garcia confirmed the good opinion we had formed of him. The new lady is an accomplished and practised singer, but scarcely fitted by *physique* for *Violetta*. Mr. Swift was the *Alfred*.

Royal English Opera.—At Covent Garden Mr. Macfarren's new opera to Mr. John Oxenford's *libretto*, titled "Helvellyn," has satisfied his admirers, and given Madlle. Parepa and Madame Lemmens-Sherrington an opportunity to distinguish themselves, of which they make good use. Mr. Alberto Lawrence also sings his part well, and gives promise. What seems to be wanted here is a really good tenor equal to the house. How is it that we grow so few such in England? What is the Royal Academy of Music doing? The Cumberland scenery for "Helvellyn," though a little too heavy, is well painted, and some country sports and dances supply prettily the looked-for ballet.

Books Received.

Compensation to Land and House Owners; being a Treatise on the Law of the Compensation for Interests in Land, &c., payable by Railway and other Companies. By Thos. Dunbar Ingram, Barrister-at-Law. London: Butterworth, Fleet-street. 1864.

According to a statement by Sir Fitzroy Kelly in 1856, the Lands Clauses Consolidation Act, and others of a series, had been since 1845 applied to above 3,000 local and personal Acts, and by this the printing of 130,000 pages of matter, which must otherwise have been introduced into those Acts, had been spared. The volume before us has for its object to explain in an easy and intelligible way the clauses of those Acts, which, being incorporated with each special Act authorizing an undertaking, enable companies to acquire lands and premises, and which secure compensation, though not always satisfaction, to all parties interested in the lands or premises taken or injuriously affected.

At starting, Mr. Ingram treats at some length the question of how much a company may be forced to take on requiring a part of a property. The difficulty of deciding is lessened day by day by decisions. Thus, quite recently, in the case of Pulling *v.* The London, Chatham, and Dover Railway Company, the question was, whether the company, having taken, for the purposes of their railway, part of a field adjoining the plaintiff's house, were bound to purchase the whole house. The case was heard (on an appeal from a decree of the Master of the Rolls) by the Lords Justices, who held that, where land adjacent to a dwelling-house is not so closely connected with it as to pass by a deed of conveyance of the house, it will not be considered as part of the house within the 92nd section of the Lands Clauses Consolidation Act. Thus the decision of the Master of the Rolls was affirmed.

Mr. Ingram, in his book, alludes very properly to the injustice often suffered by tenants without leases, or whose leases have but a short time to run. The tenant would not, in all probability, have been disturbed but for the works of the company; he may be sent out at a most unreasonable time, his business may be broken up, and yet the company may contrive to avoid payment of any compensation. Certain cases, however, have been settled by magistrates, if we remember rightly, which show that such tenants are not always without remedy.

Various necessary Forms are given in an Appendix, together with the Lands Clauses Consolidation Act, the Railway Clauses Consolidation Act, and the Lands Clauses Amendment Act, in full. There is, moreover, a good index. The author states in his preface that he "has spared no pains to make his treatment of the subject at once clear, accurate, and complete," and we are disposed to add that he has succeeded.

The Railways Construction Facilities Act, 1864. By Charles Wordsworth, Q.C. London: Shaw & Son. 1864.

Mr. Wordsworth's name is a guarantee of the value of the notes which accompany his edition of this important Act. He has likewise given an abstract of nineteen general statutes incorporated with it, and added the Act for giving additional Powers to existing Railway Companies.

The "Facilities Act" should prove of value, and, doubtless, will. By its means, as some of our readers may require to be told, a railway, and works connected with a railway, *all parties consenting*, may be made without obtaining a special Act, but with all the same powers as are usually granted in one.

First Help in Accidents. By Chas. H. Schaible, M.D., Ph. D. London: Hardwicke.

In no instance is the application of the trite saying, "A little knowledge is a dangerous thing," less doubtful than in the practice of surgery, as adapted to the relief of accidents met with constantly in every-day life; and we rather fear that the little work published by Dr. Schaible will tend greatly to disseminate this dangerous amount of knowledge, and to increase that officiousness of incompetent persons which is so frequently apparent after an accident, and is usually hurtful to the sufferer. We must do the author the justice to say, that his advice in the first instance is always to send for medical assistance; but this will have little effect on the class of persons we allude to; for, already sufficiently satisfied with their own attainments, they will, after the perusal of this little book, consider themselves fully competent to undertake, without assistance, any and every surgical casualty. The author has gone too far for the general public, and not far enough for those he professes especially to instruct; viz., those who are called upon to undertake the entire charge of a case,—a fractured bone, for instance,—without the possibility of obtaining professional advice at any period of the treatment,—a class of persons necessarily very limited. The instructions are very clearly laid down, but it is utterly impossible to convey in words that which can only be learned by practice; and it would have been better if Dr. S. had restricted his remarks to those preliminary and urgent matters which may be safely left to non-professional assistance, instead of giving minute instructions for further treatment that cannot properly be carried out. As a test somewhat within our capacity, we have looked in vain for the recommendation of common whitening and

er in the treatment of burns, which has been
ch talked of lately, and highly approved, as
sessing the two great advantages of being
ays at hand and invariably successful; but we
t the old remedy, flour, has a prominent place,
ough it is doubtful whether it is of much
especially if the injury be severe. There is
o useful information as to the transport of
ured persons, although it might have been
complicated, for general use. In conclusion,
re is a great deal in the book that should be
erally known, and as much more that had
ter be left alone by non-professional persons.
The information prominently set forth, that
smallest cubic space for healthful breathing
each adult should be—
In bedrooms, 300 cubic *inches*;
In sitting-rooms, 400 „ ;"
we suppose, a *printer's* error.

Miscellanea.

The Thames Embankment Contracts.—Some the vestries are holding meetings and discussing the statements that have been made. The Board of Works have passed a resolution expressive of great dissatisfaction, and forwarded a copy of it to the Metropolitan Board Works.

Social Science Association.—The law department of this Association has held a meeting, presided over by Lord Brougham, at which Berryer and M. Desmarest, of the French bar, were present, and addressed the meeting. The standing committee of the department, in their address, alluded to the desirability of the concentration of the law courts in a central situation being carried out as proposed; and to the evils of the patent law and the improvement it its present procedure.

Inauguration of the Salford Prince Consort Memorial.—The statue to the memory of the late Prince Consort, the work of Matthew Noble, and erected in the Peel Park, Salford, as a companion to that of the Queen, which was inaugurated by the late Prince himself, has been unveiled, in the presence of a large assemblage of the subscribers and members of the Salford town council. The statue is in white Sicilian marble, with a grey granite pedestal, and cost £1600*l*. The Prince is represented in his robes as Chancellor of Cambridge. The subscriptions received amounted to 1,932*l*., so that a considerable balance will remain in hand, and will be devoted to the museum. The granite pedestals for the statues of the Queen and Prince are from the works of M'Donald, Field, & Co., of Aberdeen. This park now possesses four statues—viz., Sir Robert Peel, in bronze; Mr. Joseph Brotherton, late M.P. for the borough, in bronze; the Queen, in marble (erected in 1852); and that of the Prince Consort, just inaugurated.

Newspaper Press Fund.—A special general meeting of the members of the Newspaper Press Fund was held on Saturday last at the Freemasons' Tavern,—Mr. Godwin, one of the vice-presidents, in the chair. The objects for which the meeting was specially convened were the consideration of certain amendments in the rules and regulations of the society, which have been rendered necessary by the more extended basis and operations of the society. The committee, which was appointed some time since, placed their resignations in the hands of the meeting, but they were unanimously re-elected, with Mr. Leicester Buckingham, Mr. T. D. Chipchase, Mr. H. Corbett, Mr. Callaghan, Mr. Finden, Mr. E. Lloyd, and Mr. Edward M'Dermott. A motion was submitted to the meeting for giving to Mr. Warren, the hon. secretary, a sum of money as a testimonial for the very valuable services which he has rendered to the society for several years past. It was felt, however, that the funds in hand ought not to be applied to any purpose other than those for which they had been subscribed, and that while the opinion was unanimous with respect to the value to the society of the services rendered by their esteemed secretary, it would be the better course for the members themselves to subscribe to a separate testimonial fund, rather than by a vote such as that proposed they should appear to divert any portion of the funds from the objects contemplated at the formation of the society. A committee of five was ultimately appointed to collect and receive subscriptions to the Warren Testimonial Fund.

Death of Mr. Robert Ransome.—We have to announce the death of this esteemed gentleman, the head of the extensive firm of Ransomes & Sims, Ipswich, who died on Sunday evening at St. Goar, on the Rhine, after only a few days of serious illness.

Liebig in England.—The *Journal de Francfort* states that the celebrated chemist, Baron Liebig, has announced his intention of relinquishing his professional chair and laboratories in the University of Munich, in order to settle in London, where he has been offered an important position in connexion with a large scavenging and sewerage company.

Thomas Sutton, of the Charterhouse.—Mr. Robert T. Stothard asks us to say that, being of opinion that a statue of Thomas Sutton, founder of the Charterhouse, known as King James's Hospital, should be set up, he has made an attempt to carve a statuette of Sutton, and that it may be seen at Messrs. Jennings's, Cheapside. We comply for the sake of his name.

Removal of the 1862 Exhibition Building.—Some other portions of the Exhibition building at South Kensington have been blown down by the Sappers and Miners. Unless we are to suppose that the operations have been arranged with a view to protracted interest, there must have been some horrible bungling in the affair. Sir John Burgoyne ought to be asked seriously to explain it.

The Nottingham School of Art. — This school has been transferred to the new building in Waverley-street, adjoining the Arboretum. The edifice is not as yet complete: the front building has been roofed in, but the tower will not be finished for some months to come, and the grounds are necessarily in confusion. The class-rooms, however, are habitable. The lighting of the rooms is from the roof as well as from the walls, the degree being regulated at will by a simple contrivance for raising or lowering the blinds. The inauguration of the building will not take place till next year.

Bradford Street Improvements.—Mr. Picton, the umpire in the arbitration case of Joseph Rhodes *v.* The Corporation of Bradford, has awarded the claimant the sum of 5,410*l*. in respect of his leasehold interest in property in Well-street. The amount asked on behalf of the claimant was 7,000*l*., while the corporation, through the town-clerk, contended that 2,936*l*. would be ample compensation.——Mr. Holme, the umpire, has awarded the Misses Stansfield 1,987*l*. for 183½ square yards in Market-street, making 9*l*. 16s. 10d. per yard, with 10*l*. per cent. added for compulsory taking; and to Mr. Wm. Metcalfe 2,156*l*. for 176½ square yards in the same locality, making 11*l*. 2s. 1d. per yard, with the same addition for compulsory taking.

"English Undefiled."—An energetic purist writes,—"What does your correspondent as to St. Paul's mean by the 'feeble *response*' that has been made,' and in saying that '*decorations* and subscriptions have been *raised*.'—and i.e 'Ecclesiasticus,' too? Such affectations are really annoying. What I chiefly write for, however, is to complain of finding in a leading literary review the expression, *work-a-day world*, spelt 'worky-day world.' I have seen the same somewhere else within the last day or two. This orthography does away with the original meaning of the phrase, which of course must have been 'work all day.' Probably the expression originated in Scotland, where it would be 'work a' day;' and we Southrons, dropping the apostrophe of elision, turned it into 'work-a-day.' That is still a good sensible adjective, but 'worky' is puerile, and sounds like babies' talk." Ugly it certainly is, and very sensible is our correspondent's suggested derivation, which favours "work-a-day." Those who write "worky-day," however, can go to some of the dictionaries for authority, wherein, though marked "obsolete," it is set forth as a corrupted orthography of *working-day*, and backed up with Shakspeare's line,—

"Tell her but a *worky-day* fortune."

It has been suggested that *work-a-day* comes exactly under the category of *now-a-days*, which merely means *now-days* (i.e., the present time); the *a* being introduced entirely *euphonic gratiâ*. So *work-a-day* is equivalent to *work-day*, a much more legitimate formation than either *working-day* or *worky-day*, notwithstanding what we may read in Shakspeare, whose orthography is surely no guide to us *now-a-days*.

Property Insured.—The estimated value of property insured from fire last year was 1,106,450,000*l*. — the amount of duty paid 1,050,679*l*., a fraction more than 1s. 10½d. per cent.

Proposed Roman Catholic College at Oxford.—The site of the old Oxford workhouse has been purchased by Dr. Newman, and a Roman Catholic college and establishment, it is said, will be shortly erected thereon.

Sanitary State of Hyde.—Typhus fever is very prevalent in Hyde, and in some houses there are as many as five of a family suffering from it. With the intention of checking the disease as much as possible, the local board of health are taking active measures to compel the inhabitants in the lower parts of the town to thoroughly whitewash and purify their dwellings.

The Proposed Vestry-hall for St. Luke's. The report of the Parochial Offices Committee was read last week to the vestry. It stated that applications for tenders had been made to twelve builders, but that the result was so much more than they could recommend the vestry to incur, that they had requested their surveyor (Mr. Christie), assisted by Mr. Stent, of Westminster, in consideration of the surveyor's other duties, to modify the plans and specifications; and a reduction had thus been made (from about 9,000*l*.) to 7,000*l*., by substituting cement for stone, deal for oak, and so on. The cost, on loan, payable in thirty years, would average 350*l*. a year, or a halfpenny rate. The consideration of the report was adjourned.

Fall of a Church at Cheriseu. For some time past an edifice, intended for a Congregational church, has been in course of erection on Weybridge Common, opposite the York-road, leading into Oatlands Park, and it was approaching completion. On Saturday in last week, however, as the men were getting to their places on various parts of the building, especially on the tower, which is about 80 ft. high, and where some men were putting on ornamental tiles, the whole structure gave way, the side walls that took the broad span of the roof bulging out, and the tower toppling over, the whole coming to the ground. Fortunately all the men who saw the tower topling over were enabled to get clear of the building, but several that were at work on the tower were frightfully injured.

The Proposed New Bridge over the Tyne. At the River Tyne Commissioners' Rooms, a model of the proposed swing-bridge over the Tyne, on the site of the existing Old Tyne bridge, has been on view. It is the design of Mr. Ure, the engineer to the Commissioners. The bridge has received the sanction of the Board of Trade. It will cross the river on the site of the present structure. It will be of iron, and its width is to be 45 ft., or 11 ft. greater than that of the existing viaduct. About 25 ft. will be given to carriages, and 10 ft. on each side to foot-passengers. Midway in the river, a transverse pier will extend from the west side of the high-level bridge, at its central pier, to the east side of Tyne bridge, forming a platform between the two viaducts; and the swing, when thrown open, will overlie this pier. The engineer has made provision for all the requirements of traffic, both on and over the water, and on the banks of the river.

The Whitcomb Reservoirs at Gloucester. A report from the surveyor was read at a recent council meeting, in which he stated that he had prepared plans and sections for the repairs in regard to the slip at the Whitcomb Reservoirs. The work would be finished in a fortnight. He had discovered that the slip was greater than had at first been supposed. The earth had moved horizontally 20 ft. at the foot of the slip, and for a length of 110 or 120 ft. along the embankment. It would require 6,000 tons of stone, and that quantity would soon be used. The total cost incurred up to the 8th of October was 1,170*l*. 10s. 8d. The approximate estimate for completing the work was 70*l*. 5s.,—total, 1,240*l*. 15s. 8d. The estimated cost, as submitted on the 12th of August, was 1,004*l*. 10s. The excess over the original estimate was due to the necessity of having upwards of 2,000 tons of stone more than was at first thought requisite. A grumbling discussion followed the reading of the report, some of the speakers doubting the sufficiency of the reservoir even when repaired, as a great error had been committed in the construction of the works.

Discovery at Pompeii.—The excavations at Pompeii have just led to the discovery of a temple of Juno, on the flags of which were scattered more than 200 skeletons. They are those of women and children who, during the eruption of Vesuvius, had hastened to the temple to seek refuge and implore the protection of the goddess.

The Hercules Statue, recently Found at Rome.—The jury on the Hercules has made a minority and majority report, the former being that it is a first-rate work of the best epoch of Greek art; the latter being that it is one of the best examples of one of the best epochs of Greek art. The Roman correspondent of the *Star* thinks the latter the right opinion. It is not Phidian, he thinks, by an immense distance. The jury valued it at not less than 35,000 scudi, and not more than 50,000 scudi, and the Government had signified their intention to take it; but as they are not provided with the funds, they propose to open a subscription for the purpose. The owner valued it at 100,000 scudi.

Traces of an Ancient British Town near Edinburgh.—In the vicinity of the "cat stane," about six miles from Edinburgh, and near Craigiehall, the traces of an ancient town have been discovered by Professor Simpson. Accompanied by Dr. Macbean and Mr. Hutchinson, he made an extensive and systematic investigation, the result of which was that they exposed portions of the faces of the three lines of walls, and one of the raised circles inside. They also were fortunate enough to discover a gate which had formed one of the entrances to the encampment. The ramparts are arranged in a fortified manner, as parallels, and towards that part of the hill from which alone any attack could be made, the other sides presenting natural barriers which, in those times, no invading force could have hoped to overcome. Excavations were made behind an old stone kist, which would seem to have been placed just outside the city walls, but nothing of interest was found there.

Falling in of the Sherburn Railway Viaduct. — An accident has occurred at the Sherburn viaduct of the North-Eastern Railway. The viaduct is situate within a short distance of the Sherburn Station. It is built of wood, and was erected many years ago. It is situate in a deep valley, through which the rivulet from which Sherburn derives its name passes, its entire span being something over 100 yards from side to side. Until some months ago the wooden gearing was open, but for greater safety it was determined to fill up the valley without removing the bridge, and large quantities of ballast and rubbish were cast into it. In order to take away the water from the stream, a culvert was constructed in the valley, and under the old bridge. This culvert fell in; a lake of water hence accumulated on the upper part of the valley, and the embankment gave way to a certain extent; but large quantities of rubbish have been added to it for its repair, and an attempt is being made to open a way for the water, which, however, is slowly escaping under the embankment, the culvert being nearly choked up. The people resident or employed in the valley have been warned of their danger.

Hermetically Sealed Building.— A large building is in course of erection at Cleveland, in America, which both in construction and in purpose is novel. The building is 80 ft. by 44½ ft., the side walls being 22 ft. high. The frame is up, and resembles a large church edifice. It is, however, nothing but an immense refrigerator, or sealed can of preserved fruits. The front of the building is to be used as a store: the remainder is to be walled entirely with iron, perfectly air-tight, and divided from the front part by similar walls. Within this inclosure is built another building, also of iron, with its walls about 3 ft. distant from the walls of the outer. The inner building is divided by iron walls into several smaller rooms, each of them being perfectly air-proof. Over-head will be packed tightly with ice, congealed, by a peculiar process, into a solid mass, 7 ft. thick. The small rooms will be filled with fresh fruits, the oxygen of the atmosphere withdrawn, and the room hermetically sealed. The fruit is to remain perfectly fresh until, the season having passed away, a high market is open for them, when the chambers are opened as wanted. The process has been in operation by the patentees, Noyce & Shirk, at Indianopolis, for more than a year, according to the Cleveland *Herald*; and a similar building is erecting for them in Cincinnati.

Landlord and Tenant.—In the case of Rogers *v.* The Hull Dock Company, Vice-Chancellor Wood held that a custom of letting on an estate cannot be imported into an agreement, so as to give to the word "month" the meaning of "calendar month," unless, perhaps, in the case of an estate so large that all persons living in the district may be presumed to know of the custom. The Vice-Chancellor said it was a well-known rule of law, in cases of letting premises, that "months" meant "lunar months," unless the contrary appeared.

Hackney New Town-hall.—A committee has been in operation for two years in order to effect the erection of a more commodious building, and having been by Mr. Tyssen Amherst, the lord of the manor, presented with a plot of freehold ground for a site, designs for a new edifice were accepted from Messrs. Hammack & Lambert, architects, and a contract for building the new hall entered into with Messrs. Maeers, of the Hackney-road. The foundation stone has just been laid. The principal front, facing the high road, is upwards of 100 ft. long, and surmounted in the centre by a clock tower. The material of this front is Portland stone with rustic and rock-work decorations.

Appointment of Architect and Surveyor to the Parish of Liverpool.—In reply to the advertisement which appeared in the *Builder*, numerous applications were received. The finance committee at first reduced the number of candidates to ten, and eventually to two, namely, Mr. James Montgomery, of Belfast, and Mr. Isaac Holden, jun., of Dundee, we believe. Mr. Montgomery was finally elected by a majority of 15 to 5. The salary to commence with is 500*l.* per annum. Mr. Thomas Wylie, the late holder of the office, declined to give up his whole time to the office as required, under 900*l.*, although the select vestry would have willingly given him 750*l.* to induce him to continue.

Health of Towns Act at Wigton.—A public meeting was held in Wigton, last week. The object of the meeting was to hear a lecture delivered by Dr. Elliot, of Carlisle, on some of the elementary principles of physiology, as the digestion of the food, the formation of blood, and its purification, showing the good effects pure air and good water had upon the health. Dr. Elliot strongly advocated the establishment of waterworks and the application of the Local Government Act. The chairman also spoke at some length upon the question, and strongly urged upon the inhabitants of Wigton the advantages that would result from the adoption of the Act. He did not think that the rate of both waterworks and sewerage would be more than a shilling in the pound. Mr. Gordon, city surveyor, Carlisle, was present, and said that he estimated the cost of sewerage at about 3,524*l.* The chairman asked how much of that sum would be spent in the town in wages. Mr. Gordon replied about two-thirds. The meeting declared that it would do its utmost to promote the adoption of the Act.

Origin of the Word "Palace."—"I shall trace the career of a few of those early Roman words, in order to show how words may change, and how they adapt themselves to the changing wants of each generation. I begin with the word *Palace*. A palace now is the abode of a royal family. But if we look at the history of the name, we are soon carried back to the shepherds of the Seven Hills. There, on the Tiber, one of the seven hills was called the *Collis Palatinus*, and the hill was called Palatinus, from *Pales*, a pastoral deity, whose festival was celebrated every year on the 21st of April, as the birthday of Rome. It was to commemorate the day on which Romulus, the wold-chield, was supposed to have drawn the first furrow on the foot of that hill, and thus to have laid the foundation of the most ancient part of Rome, the *Roma Quadrata*. On this hill, the Collis Palatinus, stood in later times the houses of Cicero and of his neighbour and enemy Catiline. Augustus built his mansion on the same hill, and his example was followed by Tiberius and Nero. Under Nero, all private houses had to be pulled down on the Collis Palatinus, in order to make room for the emperor's residence, the *Domus Aurea*, as it was called, — the Golden house. This house of Nero's was henceforth called the *Palatium*, and it became the type of all the palaces of the kings and emperors of Europe." —*Max. Muller's "Lecture on the Science of Language."*

The Patent Stone Bricks.—At the last meeting of the South Wales Institute of Engineers, Capt. J. J. Bodmer read a paper "On the Nature and Manufacture of Patent Stone Bricks." The writer described the process adopted by Messrs. Bodmer, Brothers, Newport, in the manufacture of the patent stone bricks. When they considered that labour was now about 100 per cent. higher than it was about eighty years since, anything which tended to lower the price of so useful and general a commodity as bricks, must be considered a timely invention. The stone bricks, he said, had fulfilled these requisites. Another very great advantage which these stone bricks had over the common bricks was, that they improved by age; whereas the common bricks skinned and deteriorated. Some of the bricks were exhibited to the members. Some had been made of Aberthawe lime and sand; others of sand and cinders; others of broken bricks and lime; and some others had been made out of slags, which were particularly hard and durable. Some of the bricks made by the patent process were stated to have borne a weight of three tons per brick, after having been made but fourteen days: others, which had been longer made, were capable of bearing about thirty tons per brick. The chief difficulty in the manufacture was that of reducing the material employed to the fineness of sand, or, better, to that of powder. We understood the writer to state that the patent stone bricks could be manufactured and sold at 12s. per 1,000. Several places were instanced where these bricks had been used.

The Sewage Question at Northampton.—A special report on this question has been made to the local authorities, by their surveyor, Mr. J. H. Pidcock, in which he states that he considers that the application to the sewage of lime and perchloride of iron, while it was in operation, was attended with greater success than any other process. It paid expenses, and produced a much richer manure, while the resulting overflow was much clearer than in any other way. "Unfortunately," continues the report, "since last spring we have been unable to procure perchloride of iron: this, aggravated by the deficient supply of water, and the now increasingly insufficient size of our tanks, has prevented us from being in such good order as I anticipated, the use of lime alone not meeting our requirement. At the works we have had no nuisance; but owing to the exposure of the liquid to the sun, in the long open ditch, before it joins the river, and its mixing with the discharge from the Asylum, it has undergone fermentation and decomposition, and has, when it reached the river, again polluted the water. To remedy this for the future, I have been experimenting on making the perchloride of iron at the works; and, I am happy to say, so successfully, that I can manufacture a better article than I can buy, at about one-third the cost, which will be a saving to us of about 50*l.* per annum. We must, however, enlarge the tanks, and adopt means for filtration, as suggested in my original report; for, as then looked forward to, the increase of the town has augmented the bulk of the sewage probably threefold, and our tanks, which were constructed on the most restricted scale for temporary requirements, are now quite insufficient for present necessities. The Board will not be led into supposing, by my reporting thus hopefully, that I wish it to be thought that I consider the problem as solved, though it is flattering to believe we are on the right road."

TENDERS.

For the erection of a villa residence at Eltham, for Mr. T. R. Jones. Messrs. H. M. Burton and H. P. Sandall, architects. Quantities supplied by Mr. James G. Lunther:—

Haward	£2,050	0	0
Gates	1,930	0	0
Mitchell	1,859	0	0

For the new Exchange Buildings, Hull. Mr. W. Botterill, architect. Quantities supplied:—

Musgrave	£7,449	0	0
Hutchinson	7,399	0	0
Simpson & Malone	6,995	0	0
Goates	6,900	0	0
Jackson	6,736	0	0
Weatherley (accepted)	6,560	0	0

For stables and cottages for Messrs. Flower & Sons, the Brewery, Stratford-upon-Avon. Mr. Thomas T. Allen, architect. Quantities not supplied:—

Giles	£1,149	0	0
Roberts & Holtom	1,024	10	0
Naden & Sons	990	0	0
Hall & Co.	960	0	0
J. & G. Callaway (accepted)	885	0	0

For building a pair of villas at Forest Hill, for Messrs. Aristie & Barker. Mr. C. H. Driver, architect. Quantities supplied by Mr. Nixon:—

Cook	£1,800	0	0
Saunders	1,700	0	0
Dover	1,535	0	0
Perry	1,493	0	0
Towell	1,475	0	0
Marshall	1,115	0	0
Lathey, Brothers	1,345	0	0
Tarrett	1,330	0	0
Rebell	1,248	0	0
Ashton	1,225	0	0
Gray	1,210	0	0

For building warehouse, 53, Great Tower-street. Messrs. Young & Son, architects:—

Myers & Sons	£1,519	0	0
King & Son	1,510	0	0
Hill & Son	1,499	0	0
Little	1,424	0	0
Conder	1,393	0	0
Hardiman & Sandon	1,362	0	0
Chessham	1,347	0	0
Anley	1,186	0	0

For erecting marble sawing mills, &c., Auckland-street, Vauxhall. Mr. F. G. Widdows, architect:—

Axford & Co.	£2,653	0	0
Hack & Son	2,587	0	0
Downs	2,560	0	0
Childs & Son	2,450	0	0
Palmer	2,391	0	0
Enor	2,332	0	0

For repairs and alterations at No. 118, Great Russell-street, Bloomsbury, for Mr. P. Abrahams. Mr. T. W. Constantine, architect. Quantities not supplied:—

Smith	£195	10	0
Martin	190	14	0
Nash	166	0	0
Lamble (accepted)	149	0	0

For the erection of a pair of semi-detached villas at Forest-hill. Mr. Fred. C. Dyer, architect:—

Amer	£820	0	0
Dublin	730	0	0
Palmer	708	0	0

For alterations and new shop-front for Mr. Simpson, South Audley-street. Mr. Thomas Harris, architect —

Ebbs & Son	£257	0	0
Stoner	239	0	0
Hall	237	0	0
Watson	230	0	0
Mason & Son	203	0	0

For erecting the New Inn, Rushetts, Long Ditton, for Mr. W. F. Hodgson, Kingston. Messrs. Wimble & Taylor, architects:—

Colls & Co.	£1,125	0	0
Mason	1,050	0	0
Adamson & Sons	999	0	0

For alterations and additions to the Commercial Union Life and Fire Insurance Company, 19 and 20, Cornhill. Mr. John Belcher, architect:—

Conder	£9,749	0	0
Mansfield & Co.	9,466	0	0
Lawrence & Sons	9,430	0	0
Rider	9,279	0	0
Myers & Sons	9,127	0	0
Wood	8,983	0	0
Perry	8,977	0	0
Coleman	8,888	0	0

For making the roads on the Groveland Park estate, St. John's Common, for Mr. George Cooper. Mr. F. J. Collins, surveyor:—

Godley	£375	15	0
Hayr	340	5	0
Oddy (for metalling only)	244	15	0

[ADVERTISEMENTS.]

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 33 & 34, Ludgate-hill, E.C. Established 1749.

ADVERTISEMENTS.

Now ready, price 5s. by post 5s. 6d

THE "BATH CHRONICLE" BOOK OF THE PROCEEDINGS of the BRISTOL ASSOCIATION in BATH. Illustrated with an Engraving of the Bath Abbey and a Portrait of Sir CHARLES LYELL, Bart. President of the British Association. Dedicated by permission to Sir CHARLES LYELL, Bart. M.A. LL.D. F.R.S. &c

Bath: T. D. TAYLOR, "Chronicle" Office.
London: W. KENT & CO. Paternoster-row.

By one of the Contributors to "The Reason Why" Series.
Now ready, cheaper edition, cr. 8vo. pp. 384, 2s. 6d. cloth (postage 4d.)

THE HISTORICAL FINGER POST: a Handy Book of Terms, Phrases, Epithets, Cognomens, Allusions, &c., in connexion with Universal History.
By EDWARD SHELTON, Assistant Editor of "The Dictionary of Daily Wants." &c. &c.

"A handy little volume, which will supply the place of 'Haydn's Dictionary of Dates' to many persons who cannot afford that work. It contains some things that Haydn's book does not."—*Bookseller.*

"It is to the historical student and art journalist what 'Inquire Within' is to the practical housewife."—*Volunteer Service Gazette.*

London: LOCKWOOD & CO. 7, Stationers'-hall court.

Now ready, with 46 Plates, imp. folio, price 2*l.* 2*s.* (postage 1*s.* 6*d.*),

EXAMPLES of BRIDGE and VIADUCT CONSTRUCTION, of MASONRY, TIMBER, and IRON, from the Contract Drawings or Admeasurements of Select Works
By W. DAVIS HASKOLL, Civil Engineer.
London: LOCKWOOD & CO. 7, Stationers' Hall-court.

Now ready, oblong 4to cloth, price 3*s.* 6*d.* (postage 9*d.*),

PACKING-CASE TABLES; showing the Number of Superficial Feet in Boxes or Packing-cases, from Six Inches square and upwards.
Compiled by WILLIAM RICHARDSON,
Accountant, Author of "The Calculator; or, Timber Merchant's and Builder's Guide."
London: LOCKWOOD & CO. 7, Stationers' Hall-court.

NEW EDITIONS OF MR. WILLIAM FAIRBAIRN'S PRACTICAL WORKS ON ENGINEERING, &c.
The First and Second Series, in one Vol. with Illustrations, price 16*s.* each series.

USEFUL INFORMATION for ENGINEERS.
By WILLIAM FAIRBAIRN, LL.D. F.R.S. F.G.S.
Fourth Edition of the First Series now ready.

The APPLICATION of CAST and WROUGHT IRON to BUILDING PURPOSES; with 6 Plates and 118 Woodcuts. 8vo. 16*s.*
London: LONGMAN, GREEN, & CO. Paternoster-row.

Now ready, in two vols. 8vo, with two Portraits and 17 Illustrations on Steel and Wood, price 32*s.* cloth,

THE LIFE of ROBERT STEPHENSON, F.R.S. late President of the Institution of Civil Engineers
By J. C. JEAFFRESON, Barrister-at-Law. With Descriptive Chapters on some of his most important Professional Works, by WILLIAM POLE, F.R.S. Member of the Institution of Civil Engineers.
London: LONGMAN, GREEN, & CO. Paternoster-row.

MR. JAMES FENTON, ENGINEER and SURVEYOR for six years to the Croydon Local Board, OFFICES REMOVED to 10, GREAT GEORGE STREET, WESTMINSTER

RAILWAY and ESTATE SURVEYING and LEVELLING,
In any Part of the Country.
By C. C. No. 17, Hill-street, S.W.

MR. MARDON, ARCHITECTURAL DRAUGHTSMAN and COLOURIST. Perspectives, Competition, and other DRAWINGS prepared.—Address, Bedford Chambers, Southampton-street, Strand, W.C.

TO ENGINEERS, SURVEYORS, CONTRACTORS, &c.
STANDIDGE & CO. LITHOGRAPHERS, DRAUGHTSMEN, &c.
36, Old Jewry, City, E.C.
Are prepared to execute plans for Parliamentary deposit, and every other description of Lithography, to any extent, with promptitude and economy.

PARTNERSHIP.—A Partner desires to retire from an old-established Manufacturing Business, offering a good opportunity for a Gentleman to join the continuing partners on most advantageous terms. About 2,000*l.* necessary. Very suitable to Builders.—Apply to WARLTERS & LOVEJOY, 55, Chancery lane.

TO CIVIL ENGINEERS AND SURVEYORS.
PARLIAMENTARY WORK.—An ENGINEER and SURVEYOR, of long experience, is open to an ENGAGEMENT.—Address, E. M. No. 2, Grosvenor Villas, Stockwell-green, S.

ENGINEERING, SURVEYING, ARCHITECTURE, &c.—PRACTICAL INSTRUCTION given in Civil Engineering, Surveying, Levelling, Plan Drawing, Measuring, Estimating, &c., in a short Course of Office and Field Work, on moderate terms, including the use of the instruments, &c. For Prospectuses, apply at the Offices of Messrs. HYDE, SMITH, & LEWIS, Civil Engineers, Surveyors, Architects, &c. 24, Guildford-street, Russell-square, W.C. N.B. DAY and EVENING Instruction given in Architectural Drawing, Colouring, Taking out Quantities, &c. &c.

PERSPECTIVES OUTLINED And COLOURED,
And GEOMETRICAL and OTHER DRAWINGS
Prepared from rough sketches or designed by the Advertiser.
Address by letter, to ARCHITECT, 20, Gloucester-street, Gloucester-gate, Regent's Park.

SEWAGE of TOWNS.—JOHN MARRIAGE, the Lessee of the Lands upon which the Croydon Sewage is applied, ADVISES and ASSISTS Boards of Health, Corporations, Owners of Estates, and Agriculturists, &c. &c. as to the APPLICATION of SEWAGE to LAND, the mode of its distribution, the suitability and manner of laying out such Land, and all the details connected with the profitable Utilisation of Sewage. Greenhere, near Mitcham, Surrey

ARTIFICERS are required for the Offices of INSTRUCTING WARDERS in the Convict Prisons at Portland, Portsmouth, and Chatham. They must be of the following trades, namely. Masons, Carpenters, Bricklayers, Excavators, Plasterers, and Smiths, and must be competent to measure work and to direct the labour of Convicts.—Candidates must not be less than 24, and not more than 45 years of age, and should forward written applications, with certificates of efficiency, to the Office of the Directors of Convict Prisons, 45, Parliament-street, Westminster, where information can be obtained as to salary, &c.
November 10th, 1864.

FRET GLAZIERS.—GOOD HANDS may obtain lengthened EMPLOYMENT by applying to Messrs CLAYTON & BELL, 311, Regent-street.

ESTATE CARPENTER WANTED. — Must be a skilful workman: capable of house-fitting; able to measure timber, sawing, &c.; write a good hand, and keep small accounts. A Churchman, a married man without incumbrance, preferred. Wages, 17*s.* per week, with house and garden. Address, in own writing, giving references, age, &c. to Mr. LEWIS TAYLOR, Estate Office, Mells, Frome, Somerset.

FALMOUTH PARISH LOCAL BOARD.
TO CIVIL ENGINEERS.—The Local Board for the above parish are desirous of receiving APPLICATIONS from ENGINEERS fully competent to make a SURVEY, and prepare the necessary plans, &c. exhibiting a System of Sewerage for effectually draining the District. Applicants are requested forward full particulars regarding their previous engagements in similar works.—By order of the Board,
WM. WARN, Clerk.
Local Board Office, Falmouth, 25th October, 1864.

BOROUGH of WOLVERHAMPTON.—SURVEYOR to the CORPORATION and LOCAL BOARD of HEALTH.—The Town Council are desirous of receiving applications from CANDIDATES for the Office of SURVEYOR to the Corporation and Local Board of Health. Printed particulars as to the duties of the office may be had on application to the Town Clerk. Salary, 400*l.* per annum, to commence 1st of January, 1865; the Surveyor to provide the necessary office assistance, except a clerk of the works, to be employed in carrying out the Main Drainage Works. Security required. The successful candidate may have access to the plans, books, and papers, relating to the office, immediately after his appointment, with a view to his becoming acquainted with his duties. Testimonials must accompany written applications, addressed "The Chairman of the General Purposes Committee, Town-hall, Wolverhampton," and be sent in not later than the 31st NOVEMBER, 1864. EDWIN JOHN HAYES,
Town Clerk and Clerk to the Local Board.
Town-hall, Wolverhampton, October 27, 1864

ONE of the largest and best-known Gilt-Moulding Manufacturers on the Continent requires an AGENT of respectability and standing to represent them in England, either on his own account or commission. Address, S T at Messrs Samuel Straker & Sons, 25, Leadenhall-street, E.C.

THE VESTRY of ST. MARY, ISLINGTON.—ASSISTANT SURVEYOR of HIGHWAYS.—The Highways Committee will meet at the VESTRY OFFICES, Upper-street, Islington, on MONDAY, the 28th day of NOVEMBER instant, at SIX o'clock in the Evening precisely, to receive APPLICATIONS from CANDIDATES for the office of ASSISTANT SURVEYOR of HIGHWAYS. Applicants must be between 25 and 40 years of age, good draughtsmen and penmen, and practically acquainted with road making and paving, and able to keep the necessary accounts, and to perform such other duties as circumstances may demand, and as may be required by the Vestry under the direction of the Surveyor. The salary will be 100*l.* per annum. Applications in the handwriting of the parties severally, and by them respectively executed, addressed, are to be delivered at the Vestry Offices, on or before TWELVE o'clock at noon of the said 28th day of NOVEMBER; and the Candidates are to attend the meeting of the Committee. Particulars of the duties to be performed on application at the Vestry Offices, Surveyor of Highways Department, between the hours of Ten and Four o'clock.
JOHN LAYTON, Vestry Clerk.
Vestry Offices, Upper-street, Islington, 10th Nov. 1864.

WANTED, as DRAUGHTSMAN and GENERAL ASSISTANT to a LANDSCAPE GARDENER in the North of England, a PERSON who writes and draws neatly and with facility, and has a good knowledge of gardening and ground-work. The salary will be in proportion to the degree of competency. No one but a truly respectable, gentlemanly character, whose moral and professional character can be thoroughly attested, need apply.—Address, by letter only, stating age, antecedents, whether married or single, and salary required, when copies of testimonials, to E. KEMP, Birkenhead Park, Cheshire.

WANTED, for a Builder's Office, a Young MAN, about fifteen or twenty, used to the trade, for BOOKING TIME and MATERIALS, &c.—Apply by letter, in own handwriting, to G. at Mr. Miram's, 20, Chiswell-street, E.C.

TO CIVIL ENGINEERS.
WANTED, a DRAUGHTSMAN, accustomed to railway bridge work.—Address, with copy of testimonials and terms, C. E. Morgan's Advertising Office, Bradford.

WANTED, an APPRENTICE to the CARPENTRY and JOINERY BUSINESS. Also a few steady Young Men as Improvers in the above trade. Address, by letter, stating age, W. E. P. 6, City-terrace, Devons-road, Bromley, N.E.

TO BRICKMAKERS
WANTED, immediately, the Services of an experienced BRICKMAKER, who will undertake to manufacture with his own plant, machinery, & first-class bricks at the rate per 1,000 on a brickfield (of an extent of 30 acres), in Surrey, near to Morden and Worcester Park Stations. Plan of the site may be seen, and further particulars obtained at the Offices of Messrs. WIGG & OLIVER, Architects and Surveyors, 7, Bedford-row, W.C. None but experienced and respectable parties need apply.

WANTED, at a LIME and CEMENT WHARF, a respectable Person as CLERK and COLLECTOR. Must thoroughly understand his business, and give references as to his respectability and trustworthiness. JAMES LYNE HANCOCK,
VULCANIZED INDIA RUBBER WORKS, Gaswell mews, and 208, Goswell-road, London, E.C.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 21 Wharf, Macclesfield-street North, City-road Basin, N. Sudly, that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor; and fully, that the "Reports of the Juries," page 561, of the Great Exhibition, 1851, note the grant of a First-class Medal and rank the Manufactories known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION.
MAGNUS'S ENAMELLED SLATE obtained the Medal of the Society of Arts; the Prize Medal at the Great Exhibition, 1851; Two First-class Medals at the Paris Exhibition, and Two Prize Medals at the International Exhibitions of 1862.
Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.
Chimney-pieces, Billiard-tables, Table-tops, Baths, Wall linings, &c. a New Illustrated Catalogue of which can be had at the Pimlico Slate Works, 39 and 40, Upper Belgrave-place, Pimlico, S.W.

PRIZE MEDAL TO MAW & CO. INTERNATIONAL EXHIBITION, 1862.
IMPERISHABLE TESSELATED PAVEMENTS, combining a highly decorative and economical substitute for ordinary floors of their perishable coverings. MAW & CO.'S Pattern Book, designed by M. Digby Wyatt, Esq., together with a specification and estimate of cost adapted to any given dimensions of hall, passage, conservatory, verandah, frieze, &c. will be sent on application to Benthal Works, Broseley, Salop.
May be seen at the Exhibition of Building Inventions, &c. now open at the Galleries of the Architectural Exhibition, 9, Conduit-street, free.
London Agents—W. B. SIMPSON & SONS, 456, West Strand, who have on view a great variety of Specimens of the Pavements.

VENTILATION—PURE AIR.
Sheringham's Day and Night Ventilator for the admission of Pure Air

THROUGH THE EXTERNAL WALL.
These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street, Borough, London.

MINTON & CO.
HAVE REMOVED FROM ALBION PLACE, BLACKFRIARS, TO 50, CONDUIT STREET, REGENT STREET.
ENCAUSTIC AND OTHER PAVEMENTS.
EARTHENWARE AND PLAIN TILES.
DESIGNS AND ESTIMATES PREPARED.
MANUFACTORY, STOKE UPON-TRENT.

PARIAN CEMENT for INSIDE WORK.
With this Material Houses may be finished and occupied in one-fourth the usual time, as Parian Stucco may be painted or papered within forty-eight hours. A finer quality produces a beautiful and hard sculptola imitation of marble.—Manufacturers, FRANCIS, BROTHERS, & POTT, Nine Elms, London.

COLES, SHADBOLT, & CO.
CEMENT MANUFACTURERS,
LIME BURNERS,
BRICK MAKERS,
SLATE, TILE, DRAIN-PIPE, HAIR, LATH, and FIRE-GOODS MERCHANTS,

LITTLE CASTERTON FREESTONE.
Apply, for prices, &c. to
OCTAVIUS N. SIMPSON, STAMFORD,
The Owner; and see Specimen at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect oolite) is raised in blocks of any portable size, and is about 4 feet thick in the bed. It will stand ANY WEATHER, is much used for water works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.
*** The above WEATHER STONE is used largely by London Builders.

W. & J. FREEMAN, Merchants in the various descriptions of STONE, GRANITE, and SLATE, for Engineering and Building Purposes. Supplies direct from the Quarries, by vessel or railway. Direct communication with the principal ports for EXPORTATION. Wharf prices and estimates for special contracts, including quarry work or other labour, forwarded on application.—Office, 27, Millbank-street, London, S.W.

Made at EAST COWES PARK,
Can be seen in the Constructional Department,
KENSINGTON MUSEUM.
R. LANGLEY, Agent.

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr. ROBERT WHITE, and which may be seen in operation at the Brickfields of
J. B. WHITE & BROTHERS, Erith, Kent.
The advantages of this plan are two-fold,
1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving.
2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.
Licenses for use of the Patent granted to Brickmakers, on application to the Patentees 17, Millbank-street, Westminster.

OLD PLAIN TILES.—Upwards of 13,000 Good Sound Old TILES TO BE DISPOSED OF.—Apply to Mr C COOPER, East-street, Maidenhead.

HUBBUCK'S PATENT WHITE ZINC PAINT.
By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.
ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. Such persons, using the name of "Improved Zinc Paint," for the sake of Two or Three shillings, no workman can produce good work with it. Those who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.
CHEAPNESS.—Not only is it less per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as five hundred weight of white lead and twelve gallons of oil.
EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."
THOMAS HUBBUCK & SON,

Catalogues on the Premises; at Mr BROTHERHOOD'S Works, Chippenham; and of the Auctioneer, at his Repository, Barbican, London.

ALEXANDRA PARK, Wood Green Station, Great Northern Railway.—Horses, Vans, Carts, Harness, &c.—Messrs. Kell & Grant's Second Portion, that have been employed removing Materials from the International Exhibition to Alexandra Park, some of the finest young H. Lond-n

MR. J. GOWER will SELL by AUCTION, on the WORKS, as above, on THURSDAY Next, NOVEMBER 17th, at ONE o'clock, Thirty Powerful, Strong Active CART and VAN HORSES, 6 timber carriages, 6 spring vans, 12 one-horse carts, thill and chain harness, chaff machine, nosebags, cloths, stable utensils, &c. The horses have been purchased regardless of cost, are worthy the notice of noblemen and gentlemen requiring superior horses for heavy draught purposes; the vans, carts, &c. built expressly for this contract within the last few months. The whole for absolute sale. On view two days prior. Catalogues on the Premises and of the Auctioneer, at his Repository, Barbican.

KENT.—Valuable Building Land, close to the Town of Maidstone, in 4 Wood Lands in the Parish of Boxley.

MESSRS. DANIEL SMITH, SON, & OAKLEY have received instructions to SELL by AUCTION at the STAR HOTEL, Maidstone, on TUESDAY, DECEMBER 13, at THREE o'clock, in Eight Lots, the following eligible FREEHOLD PROPERTY, near to the thriving town of Maidstone, in a very pretty neighbourhood, viz. two inclosures of Freehold Land, beautifully situate a short distance from the town of Maidstone, on the north side, containing together about 21 acres, commanding extensive and picturesque views. They have frontages to two roads, and are well adapted for building purposes. Also, on the opposite side of the road to Bearsted, a wood, known as Scrabb's Wood, containing about 20 acres, together with a cottage, garden, and orchard, barn and yard. The also commands fine views. There is a considerable quantity of timber. It is in a good situation for the erection of a first-class residence. Two lots of Building, or Accommodation Land, in the parish of Boxley, close to Maidstone, and with valuable frontages to the river Medway, containing together about 6 acres. These plots adjoin Messrs Macey & Co.'s paper-mills, and are in a capital situation for the erection of manufacturing premises. A Ground-rent of 40l. per annum, well secured upon the paper mills and premises of Messrs Macey & Co. and the dwelling-house adjoining, the whole occupying an area of about 3 acres. Also a thriving Copse, known as Abbot's Little Cowtack Wood, in the parish of Boxley, on the road to Bearsted, containing about 14 acres. Particulars and plans may be had of Messrs. DENNETT, DAWSON, & THORNHILL, 8 Hatton, 2, Nicholas square, Lincoln's-inn; I. P. EVANS, Esq. Grift, near Nuneaton; H. PEPPERCORN, Esq. East Malling, Kent; at the Place of Sale; and of Messrs. DANIEL SMITH, SON, & OAKLEY, Land Agents and Surveyors, 10, Waterloo-place, Pall-mall, S.W.

To Timber Merchants, Builders, Cabinet and Pianoforte Makers, &c.

MESSRS. LEREW will SELL by AUCTION, on the PREMISES, Camden terrace, Camden Town, on MONDAY, NOVEMBER 14th, at ELEVEN for TWELVE precisely, the capital STOCK, viz. 13 loads dry lime-tree (plank and boards), 250 yellow and white pine planks, deals, and battens, 2-cwt. pine planks and deals, 250 pieces pine flooring, mahogany, wainscot, mahogany, and other stuff, 2 feet by 2 square, oak rails, quartering, 3 by 3 ditto, 15 scaffold poles, lads, and all materials, paving, slates, varnish, &c.—Access by Offices, Cardington-street, Hampstead-road.

To Builders and Others.—Builders' Ironmongery, Stoves, Range Stock Piping, Iron Doors, Stock of Paperhangings, removed from City Warehouse, being pulled down; 50 tons of Sash Weights, Marble Chimneypieces, Carpenters' Tools, and various effects, in the Building trades.

MR. W. HOLLINGSWORTH is instructed to REMOVE and SELL, at his AUCTION ROOMS, 13, High Holborn, on MONDAY NEXT, at ONE o'clock, a variety of BUILDING MATERIALS.—For particulars, see catalogues, which can be had of the Auctioneer.

KING STREET, WESTMINSTER.—The Useful Materials of Extensive Stabling.

MESSRS. RUSHWORTH, JARVIS, & ABBOTT are instructed to SELL by AUCTION, on the Premises, on TUESDAY, NOVEMBER 15, at ONE for TWO precisely, in Two Lots, the MATERIALS comprised in fourteen sets of Stabling, consisting of stock brickwork, sound Lumber in roofs and floors, stable fittings, and other materials. May be viewed the day preceding, and catalogues obtained on the Premises, and of Messrs. RUSHWORTH, JARVIS, & ABBOTT, Savile-row, W. and 13, Change-alley, Cornhill, E.C.

TO BUILDERS and DECORATORS.

PARTNERSHIP or OTHERWISE.—This genuine advertisement presents itself to a person wishing to EXTEND a LONDON BUSINESS. The Advertiser is very old-established, situated at no less than London, in the branches of a plumber, decorator, and occasionally general repairs. The connexion consists, and is valuable to be, of first-class resident gentry. The offer would be most advantageous, particularly to a London firm, in either of the above trading branches. An interview will be given.—Apply by letter, with name and address, R E R, Money-order Office, Tooley-street.

TO BUILDERS.—TO BE DISPOSED OF (in consequence of the ill-health of the principal) the excellent established BUILDER'S and CONTRACTOR'S BUSINESS carried on by the Advertiser for many years past, situated at Ipswich, and has succeeded to that highly important and improving town. Address, by letter, to Mr. Case of Mr. Charles J. Shoppee, No 11, Dwight-street, London, W.C.

ROYAL POLYTECHNIC.—Patron H.R.H. the Prince of Wales.—Re-decorated and Re-opened. Professor Pepper's new Lecture on "Sound and Acoustic Laws," which will include an instantaneous Talking Head of Albertus Magnus — Professor Wheatstone's Telephonic Concertina, Mechanism of the Piano Bullfinch.—Mr. Pepper's new and beautiful experiment, showing Harmony and Discord. The Ghost Illusion (invented by H. Pepper and Henry Dircks, C.E. inventors).—New Musical Entertainment, by Mr. R Cecil. Pagan's Ghost daily at 4.30 and 8. Sole New Lecture by J. L. King, Esq. on the late Non-Spirit Manifestations (so called), with various Illustrations.—Stokes's Memory.—Open 12 to 5, and 7 to 10.—Admission 1s.

TO BUILDERS.—A Gentleman can obtain ADVANCES for BUILDERS on their Finished or Unfinished Property, or Advances as their Wages proceed.—Address, in the first instance, to H. S. T. 63, King William street, City.

MONEY on FREEHOLD and LEASEHOLD PROPERTY, by the MUTUAL LOAN FUND ASSOCIATION (Incorporated by Act of Parliament, 26th, 14, RUSSELL STREET, COVENT GARDEN, W.C. Advances from 10l to 1,000l upon Freehold and Leasehold Property, for any term up to ten years. Mortgage redeemed, and the advance can be repaid by easy instalments. Facilities afforded to tenants to purchase the houses they occupy, by the repayment of the advance taken as rent. Greater advantages offered to borrowers than in building societies, there being no shares to subscribe for, or competition for an advance, and no deduction from the loan. No preliminary fees. Prospectus and forms of proposal sent on receipt of a directed stamped envelope

EDWARD HARPER, Secretary

TO INVENTORS.—All intending Patentees should procure the PRINTED INFORMATION regarding PATENTS—their cost, and mode of procedure to be adopted to secure it by the General Patent Company (Limited), 71, Fleet street, London. ROBERT M. LATHAM, Secretary

CROGGON and COMPANY, Manufacturers of PATENT ASPHALTE ROOFING, BOILER, RAILWAY, SHEATHING, and INDODOROUS FELT For Damp Walls, and Lining from Houses, DOWGATE HILL, London; 2, GORE PLAZZA, Liverpool; and 9, GEORGE SQUARE, Glasgow

SEDDON & CO. MEDIÆVAL CABINET MANUFACTURERS and UPHOLSTERERS, 68, South-street, London, W.—Sole Manufacturers of Holmes's Patent Church Benches and Chairs.

FIRE in GRESHAM-STREET, London, E.C. Messrs. THOMAS TAPLING & CO. Carpet Warehousemen, &c. will, until further notice, carry on their BUSINESS in the premises, all communication, at 44, Gresham street, and 72, Aldermanbury, opposite the house of Messrs. Bradbury, Greatorex, & Beal.

London:—Printed by CHARLES WYMAN, Printer, at the Printing-office of COX & WYMAN, Nos. 74 and 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the-fields; and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," No. 4, York-street, in the Parish of St. Paul, Covent-garden, both in the County of Middlesex.—Saturday, November 12, 1864.

15 tons Pitchers, 4 inches by 7 inches deep.
30 to 40 tons of Granite broached to 2 in bearings.

The whole to be delivered in the Borough at Margate, free of all charges, within 12 weeks from the day the Contract for this their acceptance of the lowest Tenders addressed to the Town Clerk, to be sent in before ELEVEN o'clock on TUESDAY, the 6th DECEMBER next. The Council do not bind themselves to accept the lowest or any Tender. WM. BROOKE, Town Clerk.

Margate, 15th November, 1864

[For remainder of Contracts see next Page.

TO BRASS FOUNDERS. — The Waterworks Committee, in compliance with the request of a large body of Brass Founders, have EXTENDED the TIME for receiving Specimens and Tenders, from the 1st to the 24th DECEMBER, 1864.

THE WATERWORKS COMMITTEE of the CORPORATION of DUBLIN, being anxious to enable the Citizens to make timely provision for the high pressure water supply about to be introduced when the new works shall have been completed, are now prepared, in accordance with the powers conferred on the Municipal Council for regulating and controlling the character of the cocks, taps, and other appliances for taking water from the water mains within the limits of the Act, to receive TENDERS, with Specimens, for the following articles, viz :—

HIGH PRESSURE BALL-COCKS, ¾, ½, ¼, and 1 inch bore, complete.
HIGH PRESSURE BIB TAPS, ¾, ½, ¼, and 1 inch ditto.
FERRULES, for connecting house service pipes with service mains, ¾, ½, ¼, and 1 inch ditto.
SHUT-OF or STOP-COCKS, ¾, ½, ¼, and 1 inch ditto.
WATER CLOSET VALVES, on the prevention of waste principle, fitted in cisterns, ready for action, complete.

The Waterworks Committee have not yet determined on any pattern or principle, and are resolved to select the most effective article for its especial purpose. Each article sent must be accompanied by a clear explanation of the specialty of the principle of construction, if any, and of the special action, the class of metal used, the price, and the prices of the same class of article in various sizes, by the single article, by the dozen, and in large quantities, as the article patented, and such other particulars as the maker may deem advisable. The specimens are to be sent to "The Waterworks Committee," City Hall, Dublin, on or before THURSDAY, the 29th of DECEMBER, 1864 and are to be removed thence by the owner when required to do so, free of all expenses to the Committee, and on the condition that the Committee may purchase any one or all of the specimens, at the price marked for the purpose of examination, and detailed experiments as to the efficiency of the principle and the perfection of the workmanship. The Committee will not be bound to accept the lowest or any Tender

DUDLEY JONES DICKINSON, Secretary.
Waterworks Committee, City Hall, Dublin, 4th November, 1864.

TO CONTRACTORS, BUILDERS, IRON-FOUNDERS, and OTHERS.—The Directors of the Peterborough Cattle Market Company are prepared to receive TENDERS for the ERECTION and CONSTRUCTION of their NEW CATTLE MARKET, proposed to be built near the Long Causeway, in the City of Peterborough, in two divisions, as follows, viz :—

No. 1.—Comprising the whole of the Materials and Labour required in Filling, Raising and Trimming the Site, laying down the Sewerage and Drainage, and Constructing the Roads and Avenues, Stalls, Standings or Pens, Sheds, Offices, Urinals, Privies, and all other Works, and completely finishing the proposed New Market.

No 2. Comprising the Furnishing and Delivery and Fixing up of the whole of the Iron Castings and Wrought Iron Work required.

Or, for the Whole of the Works.

The plans and specifications, prepared by Mr. T. C. THORBURN, C.E. may be seen, and all other information obtained, on application at our Office on and after the 19th day of NOVEMBER instant. Bills of Quantities and forms of Tender for the Work have been prepared, and copies may be obtained at our Office on payment of One guinea for Division No. 1, and Half a guinea for Division No. 2, which will be returned to parties sending in Tenders. Sealed Tenders (in the form provided) indorsed "Tender for the New Market, Peterborough," addressed to the Directors of the Peterborough Cattle Market Company," are to be sent to our Office not later than the 6th of DECEMBER next.

GATES & PERCIVAL, Solicitors.
Peterborough, 12th November, 1864.

LONDON, BRIGHTON, & SOUTH-COAST RAILWAY.—LONDON BRIDGE STATION ENLARGEMENT, CONTRACT No. 4.—To BUILDERS and CONTRACTORS.—The Directors of the London, Brighton, and South Coast Railway are ready to receive TENDERS for the execution of the WORKS in the side WALLS of the intended NEW ROOF at the London Bridge Terminus, and in the ERECTION of new BOOKING OFFICES, PARCELS OFFICE, and REFRESHMENT ROOMS at the same Terminus, according to the plans, drawings, and specification, which may be seen, and bills of quantities obtained, at the Office of Mr. F. D. BANISTER, the Company's Engineer, on or after this date. Tenders in the prescribed form only, and properly endorsed, must be addressed to the Secretary, and left at his Office, not later than ELEVEN o'clock in the forenoon of TUESDAY, the 29th instant. The Directors will not be bound to accept the lowest or any Tender.

FREDERICK SLIGHT, Secretary.
London Terminus, 15th November, 1864.

TO IRONFOUNDERS and SMITHS.—The Burial Board of Rickmansworth, in the County of Hertford, are prepared to receive TENDERS for the ERECTION of 625 feet of WROUGHT IRON RAILING, with Five Gates to correspond, to be fixed in the Churchyard. The specification and description of the railing, together with a plan of the churchyard and railing, may be seen on application to H. W. FELLOWS, Esq. at his Offices in Rickmansworth aforesaid. The Board do not pledge themselves to accept the lowest or any Tender. Tenders to be delivered on or before the 20th day of DECEMBER next.

Rickmansworth, 14th November, 1864.

TO STONE MERCHANTS, DRAIN-PIPE MAKERS, MASONS and PAVIORS, CONTRACTORS, and OTHERS.—The Board of Works for the Wandsworth District are desirous of receiving TENDERS for the SUPPLY of BROKEN GUERNSEY GRANITE and other STONE and MATERIALS; and for the Supply of DRAIN PIPES in the whole of the District; also for the EXECUTION of MASONS' and PAVIORS' WORKS, and of the various JOBBING WORKS in Repairing and Making Good to Sewers and Gullies, and for Laying Drain-Pipes in the parish of Putney; also for the Supply of HORSES, on HIRE, and for Barge Work, in the parishes of Battersea and Putney, and also for DUSTING in the parishes of Putney and Wandsworth. The Contracts are to be for One year, from 31st December next. Separate Tenders are to be sent in for each parish, excepting those for Granite and Drain-pipes, for each of which one TENDER for the whole District must be sent in. The specifications may be seen, and forms of Tender may be obtained, at the Offices of the Board, Battersea-rise, between the hours of TEN and FOUR.—Tenders are to be sent in under seal to the Board, indorsed "Tender for , parish of ," on or before TUESDAY, 23rd instant. Security will be required for the due performance of the respective Contracts. The Board do not pledge themselves to accept any Tender. By order of the Board of Works for the Wandsworth District

ARTHUR ALEXR. CORSELLES, Clerk to the Board.
Battersea-rise, Wandsworth, S.W. November 12th, 1864

LANGTON CHARITIES, LEICESTERSHIRE.—To BUILDERS and OTHERS.—Persons desirous of TENDERING for the RESTORATION of the PARISH CHURCH of Church Langton, in the County of Leicester, can obtain bills of quantities on application to the Architects, Messrs. GODDARD & SON, of Leicester, from the present date up to THURSDAY, the 24th instant. The Trustees do not bind themselves to accept the lowest or any Tender.

JAS H. DOUGLASS, Clerk to the Trustees.
Market Harborough, November 10, 1864.

VENTILATION.—OVERCROWDING.—Boyle's System of Natural Ventilation ensures a *more* healthy condition of atmosphere in overcrowded than is usually present in thinly-inhabited or empty places. The heat arising from the state of overcrowding is the motive power which works this system with infallible regularity and effect. The smaller, closer, hotter, and more overcrowded a place is, the easier and better can it be ventilated on this system. It is applicable to all places alike, Cottages, Mansions, Public Halls and Buildings, Churches, Hospitals, Factories, Work-rooms, Stables, Cow-houses, Conservatories, and even Mines and Ships. Let no one form a hasty conclusion from the seeming extravagance of this statement. It is a far wiser plan to examine first and conclude afterwards.

"*In one instance under our own eye Mr. Boyle has operated very successfully.*"—Article, "Air in the Corners," *Builder*, 15th October, 1864.

THOS. BOYLE, No. 23, Little St. Andrew-street, Upper St. Martin's-lane, London. Agents, Messrs. COMYN, CHING, & CO., at same address.

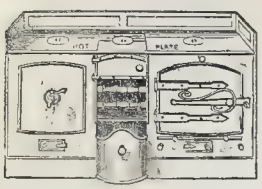
NUT PLATE.

J. B. SCAMMELL & CO. (late Thomas Pugh & Co.)
WHOLESALE IRONMONGERS,
13, KING STREET, SNOW HILL, LONDON.

We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, great improvements having been recently made in it. It has been extensively used in Public and Private Buildings, in Her Majesty's Pavilion and Camp at Aldershott—alone, many hundred sets without one single failure. It is applicable to all Locks and Latches, both Rim and Mortise, and effects a most secure fastening, without any screw in the neck of the knob. Perfect action guaranteed in both Locks and Furniture, if the Locks are of our own manufacture.



New rich Designs in Glass, China, Brass, Bronzed, Gilt, Carved Woods, Inlaid, &c. &c. or to any Design.

THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.

A most complete and extensive stock of every description of Locks, Latches, Brass Foundry, and Ironmongery, required for Buildings, of the best quality manufactured, at the lowest wholesale prices.

*** Illustrations and Particulars sent on application.

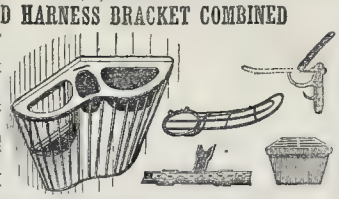
THE PRIZE MEDALS
LONDON, 1851. PARIS, 1855. LONDON, 1862.
Awarded to
COTTAM & COMPANY,
2, WINSLEY STREET, LONDON, W.
For Progressive and General Improvements in
STABLE FITTINGS AND HARNESS BRACKETS.

AWARDED A PRIZE AT THE PARIS EXHIBITION,
PATRONIZED BY THE ENGLISH AND FRENCH GOVERNMENTS, AS WELL AS BY THE PRINCIPAL NOBILITY, GENTRY, AND HUNTING ESTABLISHMENTS IN THE KINGDOM
IN USE AT HER MAJESTY'S STABLES, ALDERSHOTT AND BALMORAL.



COTTAM & COMPANY, Winsley-street, W. are the original Inventors of the PATENT ENAMELLED MANGER, Water-trough, and Wrought-iron Rack, mounted on Iron Plates, forming one complete and useful Fixture, having COTTAM'S Patent Noiseless Halter guide and Chain retained, which is taken to the back of the Manger, and works with ease and freedom up or down the guide-bar.

COTTAM'S NEW PATENT SEED-BOX, an improved addition to the above fittings, being made in a uniform neat light and durable pattern of castings, and is [illegible] adapted to all the above-mentioned fittings.

COTTAM'S PATENT PERMANENT ATTACHED DROP COVER for the above seed-box is an essential addition to the fittings; it is [illegible] can be placed and replaced in an instant; while its cheapness, simplicity, and utility in keeping the contents of the troughs clean, and regulating the quantity to be taken, is [illegible] to its use.

COTTAM'S PATENT SADDLE AND HARNESS BRACKET COMBINED

can be used with great advantage where space is an object, as it can be turned up out of the way when not in use.

COTTAM'S IMPROVED WROUGHT-IRON VENTILATING BRACKET preserves the shape, and allows the free admission of air to the under parts of the saddle.

COTTAM'S IMPROVED SURFACE GUTTER, with perforated moveable cover, the use of which prevents accidents, and can be easily cleaned out.

COTTAM'S CAST-IRON SANITARY TRAP, from its improved construction, gives a full water-passage, and does not allow any smell to ascend from the drain.

PATENT LOOSE-BOX FITTINGS, and every article for the harness-room and stable, kept in stock, plain, galvanized, and enamelled. Iron Gates, Fencing, Hurdles, &c.

Illustrated Catalogues and Estimates gratis, upon application to
COTTAM & CO. 2, WINSLEY STREET, OXFORD STREET, LONDON, W.
WHERE FULL-SIZED STALLS, LOOSE BOXES, AND HARNESS-ROOM, &c. ARE FITTED UP, SHOWING ALL COTTAM'S PATENT IMPROVEMENTS, &c.

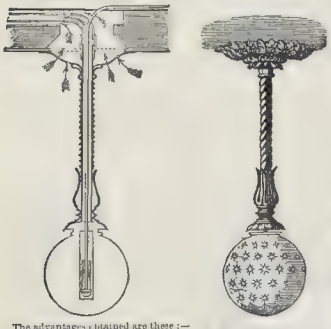
WHEN CLOSED FOR BAKING.

A Prospectus, with full description and price of the above, will be sent per Post on application.

PORTABLE STEAM PUMPING-ENGINES,
From Four to Ten-horse Power, TO LET ON HIRE, by the Week or Month.
CONTRACTS TAKEN FOR PUMPING ANY QUANTITY OF WATER.
JAMES BURTON, SONS, & WALLER,
ENGINEERS AND CONTRACTORS,
Manufacturers of Ironwork for Drainage Purposes,
JOHN'S PLACE, HOLLAND STREET, Southwark, London, S.E.
N.B. Steam Power, with Workshops, to Let



THE KOH-I-NOOR LAMP, to BURN HYDRO CARBON OILS, possesses important advantages and facilities for trimming.

BRACKET and HANGING LAMPS, for CHURCHES, CHAPELS, and PUBLIC BUILDINGS, MANUFACTURED by

JOHN WARNER & SONS,
CRESCENT, CHIPPLEGATE, LONDON, E.C.
Catalogues forwarded on application.

FRANCIS HAMMOND'S
VENTILATING GLOBE LIGHT,
combining in a portable method of lighting, with convenient, simple, and effectual ventilation.

The advantages obtained are these:—
A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION.
A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR.
AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.
A GLOBE LIGHT will consume about 7 feet of gas per hour, giving as much light as an ordinary three-light chandelier, with a consumption of 12 feet per hour.
No. 5, CHANDOS STREET, CHARING CROSS, LONDON, W.C.

SMOKY CHIMNEYS,
S. DEACON
Respectfully invites the attention of Architects Builders, &c. to his
PATENT LOUVRE CHIMNEY CAP,
which has been in use some time with perfect success, many curing chimneys where other caps have been of no avail.
The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of misplacing it; an increased up current, and the impossibility of a down one.
Prospectus, with testimonials, forwarded on receipt of Postage Stamp, by
S. DEACON,

THE IMPROVED OPEN FIRE KITCHENER,
Manufactured by
WM. OWEN,
PHŒNIX IRON WORKS,
ROTHERHAM,

Possesses all the advantages of the ordinary Close Fire Kitchener, in having excellent Hot Plates on top of Ovens, for boiling, steaming, or stewing, with the additional advantage of having a thoroughly effective and deep OPEN Fire for roasting purposes.
The Ovens are heated upon Bradley's Patent Principle (under which W. O. possesses the sole right to manufacture), and by which a great economy of fuel is effected.
These Kitcheners are made of all qualities and sizes, suitable for all classes of houses, from the cottage to the mansion; and can be OBTAINED THROUGH ANY IRONMONGER in the UNITED KINGDOM.
WM. OWEN,
GENERAL IRONFOUNDER, STOVE GRATE AND FENDER MANUFACTURER,
PHŒNIX WORKS, ROTHERHAM.

WROUGHT IRON WINE BINS.

FARROW & JACKSON
Beg to call the attention of Architects and Builders to their Wrought Iron Wine Bins, which are ADAPTED (as shown) either for BRICK ARCHED VAULTS or CELLARS with FLAT CEILINGS, the mode of fixing in either case being so simple, that they may be put up by any ordinary workman. They combine great strength with lightness and economy of space, and their DURABILITY has been satisfactorily PROVED DURING nearly FORTY YEARS.
The Shelves are formed of Plates of Iron laid on Bars, which rest on the Cross-bars of the Lattice Uprights, and are removable at pleasure.
Plans and Estimates furnished, and Cellars fitted complete in any part of the kingdom.
*** As these Bins were the invention of the late Mr. FARROW, and great attention has been given to them by the present Firm, long practical experience enables FARROW & JACKSON to offer the best advice as to arrangement.
ALSO THEIR
NEW REGISTERED IRON BINS,
Made any size or shape, to fit any spare corner, with SEPARATE REST FOR EACH BOTTLE,
Peculiarly adapted for Private Cellars.
No laths are required, and all trouble of Binning is avoided. The Cellular Bins may also be had fitted with light lattice doors, affording perfect security to the contents of the Bin.

FARROW & JACKSON,
18, 17, and 16, GREAT TOWER STREET; and
1, HARP LANE, LONDON, E.C.
FACTORY, 57 and 58, MANSELL STREET.

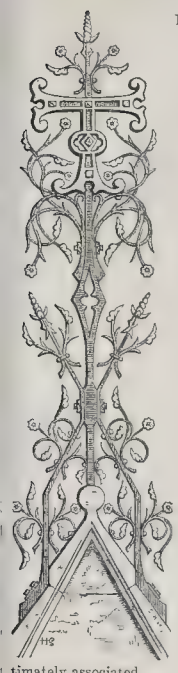
87, BISHOPSGATE STREET WITHOUT, LONDON, E.C.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. under the name of "Improved Zinc Paint," or as the number Two or Three qualities. No workman can produce good work with such stuff. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.



EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

The Builder.

VOL. XXII.—No. 1137.

*Robert Stephenson.**

HE eventful though comparatively short life of Robert Stephenson may fitly be divided into two periods,—the first that in course of which he most materially aided in maturing and carrying out the great ideas of his father and others; and the last that wherein he originated as well as realized great ideas of his own.

Of the first of these periods, of course, we shall first speak in our brief review of the "Life" now before us. Mr. Jeaffreson has manifested great diligence as well as literary ability in the collection and use of a mass of materials which now for the first time may be said to afford the public a full view of the life of the younger Stephenson, apart, as far as possible, from that of the elder, with whom, nevertheless, during the first period of his life, he was intimately associated.

It is rather satisfactory than otherwise to find that a search for ancestors has failed to elevate the forefathers of the Stephensons into either noblemen or kings; no connexion even with the more respectable Stephenson families of Newcastle having been established; which speaks well for the fidelity of the author's researches. However,—

"A gentleman of high attainments residing in the neighbourhood of Newcastle, in answer to inquiries for ancestors in the male line of George Stephenson, stated that George Stephenson, on a certain occasion, said that his family were natives of Castleton, in Liddisdale, and that his grandfather came into England in the service of a Scottish gentleman."

It is a somewhat singular coincidence that the name of Stephenson,—only spelt in the Scottish mode, with the slight difference of a *v* in place of *ph*, and which mode, perhaps, George, or his father, had they been spellers, ought, being of Scottish origin, to have adopted,—had risen into some celebrity in the engineering line, at Edinburgh, just before George arose out of the coalpits of Northumberland into the light of fame. "Mr. Stevenson, the engineer," was a well-known name in Scotland at that time; and it may be that the families were related.

The grandfather of Robert Stephenson was a fireman, as his father, George, was a breaksman; and he himself began life before his father cast off the slough of poverty and humble occupation; so that, while obtaining the elements of education at a sixpenny-a-week school, he was made useful in carrying the miners' picks to and from the blacksmith's, on his way as he went and came.

Of this we feel assured, that Robert Stephenson, who refused the honour of knighthood in his own country (though, by the way, he accepted it at the hand of the Belgian king), would *not* have regarded himself as any nobler in origin had his sire been a knight but not George Stephenson. His was a father of whom, on the whole, he might well be proud; and, modest as he naturally was, he *was* proud of his father.

It was on the 16th of October, 1803, according to the local Register, that Robert Stephenson was born, at Willington, notwithstanding that Robert's birthdays were always held in November, and he had the notion that he was born in that month. The child—"the father of the man"—was looked upon as "a wee sickly bairn, not made for long on this earth." His mother was consumptive, and died when he was three years old; but, though tainted from the maternal side, Robert inherited his father's strength, both of body and of brain; and the delicate youth grew up to a healthy and vigorous manhood. The domestic guidance of his earlier years fell mainly to the lot of his "aunt Nelly," a sensible and pious elderly maiden sister of his father's; but George was not remiss in his own peculiar style of instruction. Robert, for example, took a fancy, while at school, that he would rather like to go a-gleaning in the fields with his aunt than trudge a mile or two to school, and stay there every day; and his father, who had a high idea of the advantages of that "eddication" of which he was himself so devoid, at once allowed little Bobby to have his way, but with this proviso, that he was to follow his aunt throughout the day, gleaning in earnest, and not merely playing at it. "Weel, Bobby, hoo did the' come on?" asked his father at the close of the first day's gleaning. "Vara weel, faither," answered Bobby, stoutly. To the same question, next evening, the reply was "middlin," with a little less assurance; and on the third, his reply was, "Oh, faither, warse an' warse—warse an' warse: let me gan to the schuil agyen." With a sardonic smile, no doubt, the grim but efficient instructor of youth let his son have his own way in this request too; and next day, which was Sunday, he took him kindly on his knee, where he had often been, and told him that school was the fittest place for the like of him, and that he should thank God that he (unlike his father) did not require, in his childhood, to work hard all day for a few pence. This was, indeed, a sermon fit for a day of rest, and its influence on Robert Stephenson, we doubt not, was lasting, as must have been many another lesson of a like order emanating from so sagacious a master.

Of Robert Stephenson's boyhood there are not many anecdotes extant. He is said to have been rather a mischievous "hempy," but withal given to amusements of a somewhat higher order than those of other boys. He highly amused his father on one occasion as he watched him touching with the copper wire of his electric kite the tail of Anthony Wigham's cow, as it peacefully grazed in an adjacent meadow; but, though George witnessed the cow's cantrips with high glee, his countenance fell when Bobby adjourned from the "coo" to his father's own pony, which he next gave an electric fillip, on which his father seized the pony's whip, and rushed out upon the "mischievous scoondrel" with a threat to "pey" him for it,—a payment which Robert did not wait to receive.

The earliest "drawing" by Robert Stephenson's hand of which there is any record was that of a sun-dial, copied from Ferguson's "Astronomy," and presented by the lad, in 1816, as a token of gratitude to his father's benefactor. This drawing set both father and son to the construction of a real sun-dial, which was fixed over George's cottage door, and there it shows the time even now that both are in eternity.

Robert left school in 1819,—the year in which his father began the construction of his first line of railroad, the Hetton Colliery line,—and was apprenticed to a mining engineer, then acting as the viewer of the Killingworth Colliery, of which his father was at that time enginewright. Even George was then a young man, being only twenty-two years older than his son. Robert entered on his working life with exceedingly economical ideas. He never spent a single penny, it is said, on anything, without first asking himself Sydney Smith's three questions,—Is it worth the money? Do I want it? Can I do without it?

In 1821, when he was about eighteen years of age, Robert was appointed, by his father, as assistant in the survey of the Stockton and Darlington line of railway, of which George had been appointed engineer-in-chief; and such was the pride of the father in his son, that when the task was finished, the name of Robert Stephenson was inscribed upon the survey map as the engineer. Before the survey was made, however, George gave him a well-filled purse, and let him go to London for a holiday. Robert kept a brief journal of his visits to "Sommersite" House, and other London sights, from which it appears that he was not even then very deeply versed in the art and mystery of spelling, any more than his worthy father. After the survey Robert went to the Edinburgh University for a few months, and won a book prize in the Natural Philosophy class, notwithstanding his educational imperfections. Highly as his father estimated certain branches of education, and especially mathematics, he had no ambition that his son should have the education of a gentleman; else he could have well afforded to have sent him to Cambridge, and given him a regular college education. His determination was, that "Robert maun wurk, wurk," as *he* had worked before him.

The next great event in the life of Robert Stephenson was the appearance of his name (though he was then only twenty years old), as the head of the engineering firm of "Robert Stephenson & Co.," which George had founded in 1824, in association with Mr. Pease, and two others, as well as with his son Robert, thus manifesting anew his singular abnegation of self in favour of his son. Robert, however, was intended to act the part of actual head, or superintendent, of the business; and it went sorely against the grain with George when he found his son shortly afterwards greatly bent upon the acceptance of an offer of employment as superintendent of a "Colombian Mining" scheme, for the working of gold and silver mines, and other purposes, in Spanish America. Little thought Robert Stephenson, at that time, that the gold and silver mines which were to yield him 30,000*l.* a year, lay—not in the new world, but—in the old, and more especially in his own native country. The Spanish American scheme was a failure; but Robert, having engaged to remain out for three years, felt in honour bound to fulfil his engagement. While in America, however, he obtained valuable life experience, such as in the command of a set of turbulent workmen, who were greatly inclined to despise and disobey "the clerk," as they depreciatingly called him. On one ocasion, while they were drunk, they fairly mutinied, and were threatening a personal attack when he came quietly in among them from an adjoining room, where he had overheard the threats, which they intended him to overhear, and sat down among them unarmed, merely remarking that as they were drunk and he was sober, he had an advantage over them, of which he had no desire to avail himself if they were willing to wait till morning. As he lighted his cigar, one after another slunk out till the place was cleared, and Robert sat calmly smoking within sight of them, while they were trying to screw their courage up to an actual revolt which never took place by shouting, "One and all—one and all!" by which they meant that one and all, if any, must revolt.

* "The Life of Robert Stephenson, F.R.S., &c." By J. C. Jeaffreson, Barrister-at-Law. In two volumes. Longman & Co. 1864.

While on his way home, a remarkable meeting took place at Carthagena. There he found that eccentric genius, Trevithick, the steam-coach inventor, in a miserable state of poverty. A strange reverse of fortune had come over poor Trevithick since the time when the Peruvians received him with all the honours of a conqueror, in anticipation of the fabulous wealth which it was expected would flow to them from his engineering genius. They had absolutely shod his horse's hoofs with silver. At Carthagena, however, Trevithick was without either funds or credit; and thither he had travelled, footsore and almost starved; having suffered indescribable hardships in exploring the isthmus. To fall in with a countryman of so kindred a genius as Robert Stephenson was therefore a Godsend to poor Trevithick; and there is no doubt, on the other hand, that the original and daring views of the "Cornish giant," with respect to the capabilities of the locomotive, made a deep impression on Robert Stephenson.

On their way home, *viâ* New York, the vessel they were in was wrecked, and a circumstance which then occurred very much struck the mind of Stephenson. In the scramble to get ashore, he and his companions, who were first-class passengers, were thrust back by the mate, who singled out for vacant places in the boat a knot of humble passengers behind them, headed by a petty trader of Carthagena, who was also a second-class passenger, and was well known to be minus the means which might have made it worth the mate's while to show him and his followers any preference. Stephenson naturally wondered at the circumstance, and pondered over it, till he had afterwards an opportunity of asking the captain for an explanation, when he was informed that the Carthagenian and the mate were both Freemasons, and that this was the sole reason for the preference. So struck was Stephenson with this explanation, that he became a Freemason himself ere he left New York.

Meanwhile, George Stephenson was prospering more than ever; and when Robert returned to Liverpool he there found his father, with a salary of 1,000*l.* a year, as engineer-in-chief to the Liverpool and Manchester line, the first of the great national instalments of the new order of things. George had then his hands full with Chat Moss, across which practically bottomless morass he was literally floating a viaduct. George felt himself to be here on his trial as an engineer, and was regarded, too, by every one else as such. Just as that daring and doubtful task might prove a failure or a success, so, as he well knew, would he forthwith either be proclaimed an impudent and ignorant quack or a man of stupendous genius. He was successful; and his renown, even on this account alone, was sufficient to satisfy the ambition of any man, independent altogether of the subsequent triumph of his well-named "Rocket," on the very scene of this first triumph itself. To the success of the locomotive, however, Robert contributed in no small degree, by his exertions at the Newcastle engineering establishment. This success was based upon the multitubular boiler, an idea of Mr. Henry Booth, the Company's secretary, no less than upon the steam blast, which was generally ascribed to the Stephensons, and which had been previously used by George, in an imperfect form, in the "Puffing Billy" of a still earlier date. As Mr. Jeaffreson, however, remarks, "without the blast the multitubular boiler would have been comparatively inoperative; and apart from the multitubular boiler a strong, continuous, and regular blast was impossible."

It is rather remarkable that one of the conditions of the locomotive competition on the Manchester and Liverpool line was that ten miles an hour should be the rate of speed of the loaded train, and that the speed of the "Rocket," when first run, was so close upon that speed that 11 miles was the rate realized. When the "Rocket" went ahead, however, free of its load, "at the rate of 24 miles in the hour, shooting past the spectators with amazing velocity," it may fairly be said that the world was indeed amazed, and no wonder it thereafter ran "railway mad," as Robert Stephenson at the time expressed it in a letter to a friend. It was on this competition trial of the locomotive, as it will be recollected, that Mr. Huskisson fell the first victim to the locomotive Juggernaut. And it was the successful "Rocket" which killed him, just at the moment when he was engaged in a reconciliatory interview with the Duke of Wellington, who was on the line in one of the carriages, attached to another of the competing engines.

The manufacture of locomotives was thenceforth a rich monopoly in the hands of the Stephensons, and so indeed were the railways themselves. The effect of such success on the modest mind of Robert Stephenson was very different from what it must have been had he been a man of greater vanity and of less mental power. Instead of being anywise intoxicated, figuratively speaking, with his own position and his father's, he had fearful misgivings, expressed to a friend,—whom he had left in America, and who had only come home in 1830, when Stephenson's name had already become celebrated,—that his reputation might break under him any day like an egg-shell. It was thus in fear and trembling that Robert Stephenson established his fame.

In this year 1830 he made his first survey for the London and Birmingham line, which was formed solely by him, although his father was the appointed engineer-in-chief. There were tremendous works upon this line, especially the Kilsby tunnel, which, though let by contract for 90,000*l.* cost 320,000*l.*, and the Primrose-hill tunnel, which, though let to a contractor for 120,000*l.*, cost 280,000*l.*

By this time Mr. Stephenson was a married man: he had married in 1828; and, although he never had any children, his married life, which continued till 1841, at the close of which year his wife died, was ever regarded by him as the happiest in his experience; and, although his wife had expressed a desire that he should marry again, he thenceforth lived a single life till his death in 1859.

Having thus introduced the subject of Mr. Jeaffreson's interesting book, we shall hereafter look at it from a more technical point of view.

THE FLORENCE EXHIBITION.

THE twentieth annual Exhibition of the "Society for the Promotion of the Fine Arts" opened a few days after the close of that prepared by the rival society, of recent origin, which has taken the same name, but with the somewhat sentimental addition affixed to its advertisements, "in the bosom of artistic fraternity." This new Exhibition, containing altogether 231 pictures, of which fourteen are in water-colours, with not more than eleven pieces of sculpture, confirms the impression we received from the preceding as to the marked characteristics of the encouraging signs of progress in the Italian art of the present day. Especially in two walks, *genre* and landscape, are the relatively new direction and superior attainment conspicuous in the recent works of this country's schools; and strikingly contrasted are both the style and bias of her artists at present in repute with what we see manifest in the creations of other periods. The comparative sterility of Italian schools in landscape must strike all who regard their creations in past years, or confront the art-produce of this with that of other countries. *Now* it is landscape to which the Italian genius so devotes itself that works of this class fill the prominent place, and generally possess the highest claims to admiration, the noblest characteristics in the exhibitions of modern painting.

Less widely national than that which preceded it, the Florentine exhibition now open comprises, besides a preponderance of works by Tuscan artists, several contributed by natives of Venice, Verona, Milan, Bologna. In the figure-pieces we observe a distinct preference for Italian Mediæval subjects, either historic, poetical, or biographic (*i. e.*, from the lives of artists and poets); as well as (and here this preference has often led to admirable results), for the themes supplied by the great events of recent occurrence—episodes in the war of 1859, or the preceding revolutions. The sacred subjects are few, and their treatment little remarkable; the Holy Families cold and uninteresting, the Madonnas conventional; but one of this class, "Ruth gleaning in the Field of Boaz," has the merits of novelty *as* a subject, and of a pleasing truthfulness in conception, though, indeed, far surpassed by the other groups of the same artist, Fanfani, who has contributed some of the very best works to this collection. We have in the class that may be called national,—the genre subjects that illustrate Italian celebrities,—"Dante Alighieri in Youth" (Trionfi),—a single figure, walking through a street of Florence, absorbed in meditation; another "Dante" (Petarlini), also solitary, reclining on a mountain side above the sea-shore; and, again, "Dante in exile taking refuge at Melazzo, with the Marquis Malaspina" (Parrini), a group far superior in expression and power to the isolated figures of the same poet. "Michelangelo in his Studio, reading his Poems to the Widowed Vittoria Colonna" (Fanfani),—a pleasing and very expressive group; the quiet earnestness of the artist and the matron dignity of the lady alike truthful; a fine mellow tone over the whole picture. By the same, "Cimabue proposing to the Father of Giotto to Undertake his Son's Education in Art,"—a beautiful subject beautifully treated; the benevolent interest of Cimabue, the joyous gratitude of the handsome boy, the prudent deliberation of the old peasant, well and naturally rendered. Also by Fanfani, "Benvenuto Cellini in his Studio;" for explaining which same the catalogue gives an episode out of that artist's autobiography, describing his rage on the discovery of the amours between a young secretary and a model-girl,—the story here told with much dramatic effect by the painter. "Eleonora d'Este meditating on the Episode of Sophronia in the 'Jerusalem Delivered'" (Barzaghi),—a picture in which one misses the indispensable attribute of poetical imagination: the execution admirable; the draperies, hangings, details, elaborated with extraordinary skill; the lady beautiful, but cold and stern in expression, without any apparent consciousness either of loving or being loved. "Ettore Fieromosca finding Ginevra dead" (Sanesi),—a scene from Azeglio's romance, in which the dim solemnity and far receding perspective of Gothic architecture attract rather than the figures. "Medora" (Trionfi),—Byron's heroine watching beside the sea-shore at sunset for her Conrad's return; the solitary figure reminding us of the *pose* of a tragedy-queen on the stage, though her grief is earnestly expressed, her countenance noble, quite "Sidonian" in type, her rich Oriental costume finely treated. As for the largest historic picture here, "The Conspiracy of the Pazzi" (Mussini),—we can find nothing to say in its praise: the passion exaggerated, the attitudes theatrical, the colouring, notwithstanding a profusion of fine dress, cold and hard in effect. Among subjects that bespeak the absorbing interest in political events and the great national cause, we have;—"Prayer of the Zouaves over the Graves of their Comrades slain at Palestro" (Morici),—a small picture, doing some justice (not, indeed, the fullest) to so pathetic a scene; "Riflemen surprising a Brigand" (Raimondi),—a Neapolitan episode, rendered with such spirit and truth that we might suppose it taken from the life; an "Episode in the War of 1859" (Trezzini),—the escape of schoolboys, one a theological student, over the walls of their college, in intent of joining the volunteers for the Italian cause;—a comic, but yet earnest scene, the actualities trivial, the meaning profound. Other subjects indicate the strongly-marked and indeed alarming tendency to hostilities against the Church; not so much regarding doctrines, but practice, that cannot escape attention in the Italy of the present day. "A Victim of the Inquisition," (Moricci),—a nun about to be tortured before the Dominican friars, her judges, by the hooded familiars of the dread tribunal;—all the physical horrors of the scene well rendered, but nothing more; nothing to redeem or elevate into a higher sphere such revolting realities. "A Nun in the Cell of Discipline" (Riccardi), is another miserable victim of ascetic rigour; the torture of the mind rather than that of the body, purely distressing to look upon, though indeed a well-finished figure.

But the landscapes are more attractive, generally speaking, than the other works here exhibited. Before such pictures as those of two masters, certainly pre-eminent, Marko and Bensa, we forget the particular claims of the artist, of style and manipulation, in the sense of awe or delight before the glories of Nature herself,—the manifestation of Deity in our beautiful world. Marko (son of a painter distinguished in the same walk) excels in the fascinating and sunny aspects of scenery, radiant mists, visionary distances, the twilight of the forest, the broad golden lustre of summer evenings. Bensa is happiest in the grand and wildly magnificent,—Alpine solitudes, desolate wintry scenes, where the ruined castle or antique village rises amidst snow-clad heights, beside frozen waters, rocky glens, or lakes embosomed among forests and hills under the solemn effects of sunset and twilight. Besides these masters, of such unquestionable eminence, we may mention others whose landscapes exhibit power and feeling.

Donnini,—sea-coasts, sunset upon mountains, romantic distances beyond pleasant foregrounds; Pianzola,—quiet luminous scenes, lovely effects of light and shade on woods and waters; Corvini and Maioli, both excelling in forest scenery; the former also in the characteristic landscape of the Roman Campagna; Senno,—admirable for the finish of detail, the botanic study of nature, and the light of a feeling that glorifies all it touches; Calvi and Silei, both happy in scenes where a delicious repose is the leading expression; Bertelli, whose power is well displayed in a sunset scene, from the level region of Bologna, striking and truthful; Steffani, who exhibits "The Island of the Cyclops," from the Sicilian coast, a small but very impressive and finely worked up picture. Other genre subjects treated with superior abilities, are,—"The Expectant" (Giuliano),—a poor girl looking out of a cottage-window across the sea; the "Hour of the Meal" (Castaldi),—a girl feeding poultry on the stairs of a cottage-interior; and two that might well be placed together as pendants, "The Family of the Mountebank visiting their imprisoned Father" (Sanesi), and another "Family of Mountebanks" (Malatesta), where we see a daughter dying in a garret, the desponding father who counts his paltry gain, and the other children just returned from performance, still wearing the tinsel finery that enhances the effects of sorrowful realities,—both these last conceived with much feeling; and while we must give the preference to Malatesta's picture for rich and mellowed colouring, both speaking to us with true pathos, conveying lessons fraught with morality. Rapisardi, one of the ablest living masters of Italy, has contributed only a single head, a beautiful female in white drapery, the execution, indeed, worthy of its artist's repute. Among the few sculptors we have only to notice the "Genius of Glory," by Torelli; and the "Genius of Progress," by Ricci, figures of winged boys with attributes and symbols, both distinguished by grace and elasticity, the former the more ideally beautiful, the latter the more spirited and vigorous. In the catalogue are marked prices to each painting and sculpture; and we are surprised to see how low the average; 1,500 francs being the maximum in the former class.

ARCHITECTURAL REVERIES.*

THE WINDOW.

We have seen the window feature steadily advancing in importance, and marking each epoch with its reflex, more or less striking of the spirit of the time. It was, however, in the Christian churches from the tenth to the fifteenth century, in our grand Mediæval cathedrals, that the "window," as a truly decorative and all-important architectural feature, most grandly developed itself. In the earliest days of Christianity, the rites of the new religion had been performed not only in secrecy, but in darkness, in the subterranean recesses of the Roman catacombs. But when its influence had become all-powerful, these conditions were destined to be strikingly reversed in the glorious edifices that the genius of Christian architects eventually reared as the temples of their religion. A Pagan writer, Longinus, in treating of sublimity of style in literary composition (though he had a vast range of classical masterpieces at his command), cites as an example of the truly sublime expression of illimitable power, a passage from the Jewish Scriptures,—"God said, Let there be light: and there was light." It would almost seem as though those Christian architects had seized upon the same passage as their motto when, to admit a vast body of light into their vaulted naves and aisles, they proceeded to construct those broad openings in their temple walls, which were eventually destined to become the chief glory and ornament of those wonderful structures. Unlike the castle, in which the external windows were deep and narrow,—as through them might constantly be dreaded the visitation of a cloud of arrows, or dangerous masses of stone thrown upwards from the catapult,—the Christian temple could widen its window openings without fear. The influence exercised by the Church was at that period nearly omnipotent over all classes. Churches were truly sacred buildings, even the vicinity of which was a sanctuary, the bounds of which could not be forcibly passed, even in pursuit of a criminal who took shelter within the ecclesiastical precincts. There was no necessity, therefore, to make security a consideration in the design and proportion of church windows. Consequently, in order to throw a sufficiency of light within the lofty vaultings of a vast covered area, these features soon began to assume such proportions as rendered supporting mullions necessary; and these, branching eventually at the top, so as to meet the great pressure of superincumbent wall above the wide opening, gradually grew into that exquisite window tracery which forms one of the crowning beauties of the marvellous details of Gothic architecture. The art of staining and painting on glass having developed itself about the same time, these windows were gradually converted into fields for the pictorial illustration of the great story of Christianity; and the churches thus became, as it were, spacious picture galleries, the paintings of which were lighted as no paintings had ever been lighted before, for the light passed through the pictures themselves to the eye of the spectator, giving them a vivid brilliancy such as no pictorial representations had ever been endowed with at any former period, and producing a most striking effect, which, in a decorative point of view, had certainly never been equalled. Even classical art had never achieved such decorative splendour, not even in the highest period of their temple architecture, when a Phidias wrought, in gold and ivory, the celebrated Chryselephantine statuary of the Parthenon and other Attic temples. The effect produced by the translucent pictures of the painted windows was, indeed, most brilliantly rich; and at the same time most appropriate. The light streaming through them imparted an almost supernatural effect, as of pictures of coloured æther; and with these advantages neither the defective drawing of the period, nor the necessity of surrounding every feature of a different colour with the broad line-joints of lead-work, materially injured the grandeur and imposing richness of those vast pictorial compositions which at once both decorated and lighted the great cathedrals of the thirteenth, fourteenth, and fifteenth centuries. The great painted window was, in fact, the most striking triumph of Mediæval art; and it was its great success which led to the continually increasing size of the windows as a field for this kind of church decoration, which proved itself so much more brilliant than any profusion of painting or gilding could possibly be on the opaque walls. Hence arose the extreme development of another striking feature in the Gothic architecture—the buttress,—the increased strength of which was rendered necessary by the abstraction of such large portions of the walls as window space; and, with the increased size and importance of this feature, arose the necessity for its decoration, during which process, with its canopied niches and fretted pinnacles, it became one of the leading features in the external architecture of our Gothic cathedrals.

With the increased decoration of the windows in ecclesiastical buildings, those of private dwellings proportionately increased in richness and appropriateness of ornament, and in general delicacy of architectural treatment. In great cities, indeed, window decoration developed itself in an exuberance of artistic device that often renders each window quite an artistic study in itself. Tracery was not resorted to so profusely as in church windows, where it was a necessary support in such wide openings; but its beauty was so strongly felt that architects could scarcely be expected to abandon it altogether in their domestic architecture. We therefore find it introduced in the upper parts of windows where it would not obstruct the look-out. The amount of this tracery in the windows of domestic architecture greatly differed in different countries, being most profuse in Venice, and in parts of Spain, and perhaps least so in Germany and Flanders, where, on the other hand, the Church Gothic found its greatest degree of exuberance. If, however, in the windows of the household façade the feature of tracery was but sparingly used by Gothic architects, they found a vent for their skill in this class of decoration in the traceried framework with which they often surrounded their dormer windows, some of the work of which is more rich and delicate than any to be found in church architecture; among other examples, those of the Hôtel des Mathurins at Paris, and of the Palais de Justice at Rouen, may be cited as extremely beautiful. And while tracery was thus made available for the gabled top and its surroundings in the dormer window, the decoration of those of the façade by means of the enrichments of the architrave, and the introduction of a surmounting label, decorated with appropriate ornament, in allusion to the profession or trade of the owner of the house, led to a distinct class of ornament in domestic windows which had not developed itself in those of the churches. Even the painted glass was not entirely neglected by the Gothic architect of domestic architecture; but the windows of ordinary houses had to be considered as things of *use*, as well as decoration. They had to be seen through, as well as to admit light; and yet a means was found to introduce it, without inconvenience, by the adaptive skill of those true artists; and in the upper part of the window, far above the eye-line, painted shields of arms and other brilliantly-coloured ornaments were introduced, adding greatly to the richness of the interior decoration, without impeding the view from the window, or materially decreasing the supply of light.

The richness and delicacy of window ornamentation which arose in the next great architectural epoch (that of the revival) was of extraordinary beauty and almost endless variety, so much so, that to dwell fitly upon its marvellous details would be impossible in this essay; but those of Heidelburg, those of the châteaux of Francis I. and Henri II. of France, and many most exquisite and well-known examples in Germany, Spain, and Italy, should be carefully studied by all who would fully understand and appreciate the history of window architecture.

Towards the close of the seventeenth and during the whole of the eighteenth century, the treatment of this architectural feature has but an inferior story to tell; and yet art was not then in a rapid decadence, as has been till recently thought and stated. It had but assumed a new phase, and succumbed, as it were, to a new influence. It was less profuse of striking ornament, less demonstrative, but in many respects more delicate and refined, especially in the last half of the oft-decried eighteenth century; and had not the great revolution—the Neapoleonic era with its classic mania—and the subsequent reaction in favour of Mediævalism interrupted the onward course of the styles of art which were developing themselves in the eighteenth century, they might have rapidly led to very interesting and beautiful results, the precise character of which can never now be known.

The new power to which the direction of art had partially and gradually succumbed during the seventeenth and eighteenth centuries was that of the rapidly increasing female influence. It is in fact, to this kind of influence that the greater delicacy and refinement, and the less demonstrative and somewhat more colourless character of art in those epochs may be traced. The exclusively female qualities of mind had been in matters of art, as in many other fields of human activity, almost a dead letter before those periods; but when the intrigues of the boudoir became a positively influencing power even in matters of state; and when a female coterie could decide authoritatively on the merits, or, at all events, the temporary vogue and fashion of authorship, the productions of the sculptor, the painter, or the architect, it is not to be wondered at that every style of art should feel the influence of the newly developed *régime*. The new features of the artistic progress of this period were, in England, interrupted in their development by the Puritan revolution in the reign of Charles I.; but in France, even in the uncongenial atmosphere of the court of Louis XIII., the first scintillations of a decided change of taste began to make themselves felt, and assumed a very rapid development in the reign of his successor. It was then that the leather hangings, quaintly stamped and gilt, were stripped from the walls where they had hung for ages. It was then also that the rich tapestries of former periods began to disappear. Those heavy drapings from the looms of Arras and Mechlin, grim with sanguinary battle-scenes or with the scarcely less sanguinary proceedings of the Mediæval hunting-field, were not found to be in accordance with the sympathies of the new leadership of art, and gave way to silken hangings of delicate hues, enriched with scarcely visible embroideries. The old wall linings of oak or cedar, heavily carved in quaint and often beautiful devices, were too dark and massive in their effect for boudoir taste, and gave place to delicate panellings, painted entirely white, and relieved only with light and fanciful enrichments of slightly-raised ornaments, heightened with gilding; leaving the

* See p. 804, *ante*.

dresses of the court beauties to supply the rich colouring which had in their favour been made to disappear from the walls; while even the decorative pictures, when introduced, were of light and delicate tones, all more or less modified by the admixture of white, giving to them a kind of tender bloom, and producing somewhat the effect of a picture seen through gauze, or a girl's face through a white veil.

But while interior architecture, and especially furniture, was undergoing the boudoir influence of the eighteenth century, window architecture suddenly ceased to make any decorative progress whatever. Improvements in glass-making furnished larger panes, and the leaden lattice, with its variety of patterns, gave place to a plain wooden framework with its monotonous and never-varying square panes.

As architectural genius was withdrawn more and more from the monumental to the domestic in the course of institutional changes, internal comfort became, as a rule, a greater desideratum in buildings than external effect. And though, in Paris, in the course of the eighteenth century, some elegant façades arose, in which even the neglected window feature was coquettishly adorned with surrounding mouldings, made graceful with chisellings of light and fanciful character; yet the monotonous square panes had firmly established themselves as a given element in window design, and all variety in the glazed portion of this important architectural feature came to a stand, from which, even at the present time, it has not emerged.

Whether this stationary phase of window design be absolutely necessary, as arising out of the nature of the materials used and the object to be attained in the construction of a modern window, is a matter worth examining. The first question that presents itself in the inquiry is, whether wood be really the best material for the framework of the glazed portion of house-windows of a superior class, and whether strong and rudimental objections may not exist to the present system of glazing. As regards objections to this system, it may be urged that, as glass is a very brittle substance, and liable to frequent accidents, it seems a clumsy process to stick the panes in permanently with a substance that hardens in such a way that, when a new pane has to be introduced in place of a broken one, the hammer and chisel have to go to work to extract the broken glass by main force, permanently disfiguring the neatness of the framework, and rendering fresh paint necessary to cover the unsightly patching; while as the fresh paint can never be made to match the old, the whole window ought to be repainted: and even then, if the paint of the other windows of the front be rather old, the only way to make a "good job" would be to repaint the whole of them,—and all this in consequence of an accident to a single pane of glass. Now, if instead of this clumsy and primitive method of glazing, one were adopted in which a fresh pane might be put in with the same ease and neatness as putting a new glass to a watch-face, all this clumsy puttering might be avoided. And this might be easily effected at a very small increase of expense, even with the present wooden frame. But, first, let us see whether metal framing would not be in every respect superior to wooden ones. The old objection to metal, on account of its liability to expansion by heat, is not a valid one, as that quality of metal might easily be provided against. Taking it for granted, therefore, that windows might be cast in metal, either in iron, zinc, or in some mixed metal; the first advantage gained would be, that instead of the eternal square panes (any deviation from which would be very expensive in wood work), we should be able to produce elegant varieties of tracery at the same cost as the plainest rectangular pattern, after the mould had once been prepared. Then comes the subject of glazing, in such a way as that any piece of glass might be taken out and replaced as easily as the process of unlocking the lid of a box and locking it again. The plan proposed is this:—the rebate of each compartment should have a groove, into which india-rubber tubing should be fixed, of a flattened form suitable for the purpose; upon this tubing the edges of the glass would lie; and to secure the pane in its position, a light metal frame of the width of the rebate, and also lined with india-rubber tubing, should be secured to the rebate with two or more screws, thus fixing the glass: and at the same time, as the india-rubber would only offer an elastic resistance between the glass and the metal, the contraction or expansion of the frame might take place without cracking the glass; while the glass could be taken out at any time and other glass put in its place as easily as the renewal of a watch-glass, as has been said above. This process may appear complicated in description, but is in reality exceedingly simple; and when a pattern-frame is cast, with its glass-securing framelets to match, the matter of glazing, even in the first instance, would be absolutely less costly than the clumsy puttying system, while in all cases of renewal it would only be the cost of the glass, instead of, on the old system, a heavy charge for labour (half a day), which expensive labour destroys the beauty of the wooden window-frame, makes much needless dirt, much unpleasant noise, and keeps a family out of a room in daily use to the great incommoding of all the family affairs, while the clumsy piece of pottering is being glazierly and leisurely, and most noisily, accomplished.

The greatest advantage gained, however, would be to art, in the new impetus that would be at once given to design in the various new forms which our window framework would necessarily assume; giving to our domestic architecture an epochal stamp such as all former periods have enjoyed, while our own, in all its most important architectural efforts, has hitherto been one of sheer imitation, with the almost solitary exception of railway work, where entirely new conditions have actually compelled the adoption of new treatment, which is destined to result in very remarkable and very beautiful changes, though at present in a very embryonic state, from which, however, it cannot fail to emerge in due time.

Supposing the use of metal window-frames, of the kind suggested, to be generally adopted, the question arises, what kind of tracery would be desirable, and to what part of the window ought it to be confined? Taking a drawing-room window, opening to the ground, for a first experiment, it will be seen with but slight consideration that the portions of the window-space below and above the eye-line at once suggest themselves as fitting fields for ornament, without obstructing the view; say, to the height of 18 in. at the bottom of the window, and above the height of 6 ft. from the floor at the top, which spaces might be enriched, if not filled, by well-designed tracery. This open tracery might be filled with coloured glass, in graceful design, and well contrasted colours,—sober, or rich, according to the style of the apartment, its fittings, and furniture. The want of colour of this kind has been evidently felt by our modern builders, and borderings—mere linear borderings—of coloured glass, more or less ugly and vulgar, have been frequently introduced; but this has generally been the case only when it has been thought advisable to exclude an objectionable look-out from staircases or back-rooms. It is not, however, in the humble position of a screen that coloured glass is here recommended, but as a conspicuous element of beauty in the design of a window; in which, the forms of the compartments produced by the play of the tracery should be a more important feature than the coloured glass, not only from the exterior, like the stone tracery of church windows, but also from the interior, where church window tracery, on the contrary, sinks into a secondary position in presence of the striking effect of the transparent picture of which it forms the frame. This should not be the case in a drawing-room window, in which a great portion of the central space is necessarily clear glass, surrounding which the traceried framework should conspicuously exhibit its play of lines, to which the coloured glass in the interstices should only perform a subdued accompaniment. The central space of clear glass might be a long oval, in which case, instead of the opening being up the centre, the entire oval might form of itself the opening portion, and the surrounding tracery the frame to which it would be fixed. With such an opening there would be less room for tracery below it than if the window opened down the centre in the usual way, as the bottom of the opening should not be higher than could be conveniently stepped over into a balcony or garden.

Windows constructed and ornamented in the manner described would form very decorative and really novel features in an apartment; and would at the same time tend to the development of new external effects. It has been suggested, as a starting point, to make the clear portion of the window of some new shape, while still leaving the entire framework of the window of the orthodox square form. But that is not necessary; for, not to mention the glorious Catherine-wheel windows of our cathedrals, it is well known that in Chinese architecture,—a by no means contemptible school of art,—that windows of entirely oval or circular form are made to produce most pleasing effects in ordinary domestic architecture, especially where they frame, as it were, a pretty view of lawn or flower-garden, as seen from a room or passage; but even in the external design of the building they produce a novel play of lines that might be made much of by skilful and artistic management; for there is no real æsthetic reason why the basal line of a window should be always a horizontal one. Much more than has been here hinted at remains to be done in window design; it is a fertile field for architectural innovation of the safest kind, in which, if carried on with a true sentiment for art, one might in our reverie imagine many beautiful novelties evolving themselves, if one could but wait to watch them; but this dream about windows has already reached its utmost limits.

LIME ABROAD AND AT HOME.

A VERY remarkable difference in the practice of English and Italian builders in the preparation of lime, is worthy of the attention of the practical workman, as well as of the architect and of the engineer. The specifications of English contracts are directed to the object of insuring that none but perfectly fresh-slaked lime shall be made use of; and it is frequently directed that lime which has been slaked and not mixed or used in the works in the course of the day, shall be removed from the ground, so that not more than twelve hours may elapse between the first damping of the lime and its being placed in position in the building. And in works where the mortar is required to act not only as a bed, but with tenacity that shall resist displacement, as in arches, it is usual to pay strict attention to this requisite.

In Italy, on the other hand (speaking now of Southern Italy), the lime used for building is treated in precisely the opposite manner. The first thing done when a building is to be put in hand, is to slake the lime. Pits are sunk, usually lined with masonry, and a large quantity of lime is thrown into these pits, and kept under water until it is required for use. Three months is held to be the least time proper for this preparation, but as many years are considered to form a better period. The lime is found in these pits in the state of thick cream, of puddle, or even of newly-dug London clay; but it is held to be better to keep the surface of the store constantly under water. It is then fit for use at any moment, either for mixture with sand or with "lapilli," or for use neat.

It may occur to the practical man that so great a difference in the treatment of so essential a portion of the material of the builder must arise from some difference either in the nature of the lime used, or in the effect of climate upon the buildings; and that the mere circumstance of geographical distance is not sufficient to account for so diametrically opposite a practice being adopted by the educated architects of the two countries.

In reply, it may be observed that distance alone has in other instances operated as a bar to the adoption of the most important improvements in engineering practice. The generation is now fast passing away that can remember the introduction into England of that improved system of road-making now universal in the country, and known by the name of its inventor, Macadam. The father of the late Sir James Macadam did not derive his system from acquaintance with the breccia roads of Italy, but from his own observation and reflection in the first instance, and from the experience which he then gained as a country magistrate. The attention of Government was called to the system by the simple fact, that over a few miles of road near Bristol, which had been made according to what was then called the "hobby" of Mr. Macadam, the mails travelled as fast in winter as in summer. In the new arrangement of the time for the winter running of the Bristol mail, the eye of the Post-master General was caught by the fact that no extra time was allowed for this bit of the road; and on being informed, on inquiry as to the cause, that it was not requisite, he made no remark, but ordered his carriage and went to the spot to ascertain the cause. From that visit resulted the present system of English road-making.

And yet at the time when the surface of the

road from London to Edinburgh was half pitched with coarse boulders, the breccia and gravel roads of Italy were as smooth as at the present day. It is not by anything in the nature of the roadway metalling that the traveller can tell whether he is on the road from Chester to Holyhead, or from Naples to Brindisi, and if the latter great road was not as carefully metalled in the time of Horace as it is at the present day, and if the Appian Way from Puteoli to Rome was *paved* more carefully than the turnpike road from Sheffield to Leeds some thirty years since; at all events, the Italian roads of broken stone are far earlier than the date of the introduction of Macadam's improvements.

It does not appear that the difference of treatment in question is due to any difference in the character of the limestones. The stone that is burnt in the neighbourhood of Naples is the Scala limestone of the Apennines. Geologically it is probably the equivalent of the chalk, and lithologically it may be considered to rank between the oolite of Gloucestershire and the Calp limestone of Pembrokeshire. It is burnt in kilns with wood faggots, and it behaves, on coming in contact with water, precisely like the lime with which we are familiar.

It is true that there is a very great difference in climate. The Italian winter is mild, and the hot summers sometimes last for six months without a single shower. But, on the other hand, frosts, though rare, do occur repeatedly in the course of the winter; and it is not the duration or the intensity of frost, but the alternation of frost and thaw that chiefly tries masonry. And again the volcanic tufa, which is the chief building material over a large district of the country, is an exceedingly porous stone, very damp when it is taken from the quarry, and very ready to imbibe damp after it has been dried. The rain, too, when it does come, comes in torrents; and in the narrow lanes of the country. and even in the narrow "vicoli" of the towns, masonry that is never exposed to the sun is damp throughout the winter; so that the action of frost, when it occurs, takes place under circumstances the most trying to the mortar.

It can, hardly, therefore, be thought that the practice of the Italian architects is one that has been found unsuited to England, or that any such difference in the nature of the lime, or in the action of the climate, can exist, as to render that method unsuitable to this country. It is a practical question, and as such well deserves to be put to the test of practice.

Nor can it be denied that, however superior the English carpenter or smith may be to his Italian fellow-craftsman, we may learn much from the Italian mason. Masonry is native to Italy, and there to a great extent displaces woodwork. The shores of a tottering house, or the centres of a bridge, are built by the Italian mason as readily as they are fixed in timber by ourselves, and as clearly and readily removed; and the durability of Italian masonry is well known. From the frequent recurrence of earthquakes there are hardly any large buildings to be found in Southern Italy without conspicuous cracks; but each such crack is a witness of a shock that would have laid an English town in ruins. The great extra thickness of the walls is, no doubt, the main reason that the damage caused by earthquakes is not greater; but the strain is very great on all buildings, and any inferiority in the cement would not fail to be detected; and then the old Roman work existing in Roman monuments, or from time to time brought to light in excavations, is a witness to the imperishable character of the Italian mortar.

For these reasons it may be thought that the introduction of the Italian method is at least worth a trial. It would most likely pay an architect or a builder in large practice to build an experimental piece of masonry, or even a lodge or a cottage, with long-slaked lime; at all events, the subject is one which demands such attention as does not appear yet to have been given to it in this country.

F. R. C.

PROPOSED SALE OF YORK CASTLE.—Amongst the various Parliamentary notices for the ensuing session, there is one for a Bill authorising the sale of York Castle and the Judges' lodgings. The acting justices for the West Riding are the promoters of the Bill, and the real object which they have in view is to relieve the West Riding from any further liability on account of York Castle. The *York Herald* seems to think that the Government will agree to take York Castle into their own hands, but not to sell it.

PROFESSOR W. KING ON THE ANTIQUITIES OF IRELAND.

BEING lately in Dublin, assisting in the Queen's University Examinations, I availed myself of a spare day to visit the vast mound-covered temples of the Boyne, as well as the Pagan and Christian ruins of Monasterboice, in Louth, and Donoughmore, in Meath. I was accompanied in a part of the excursion by a gentleman, a builder, from Glasgow, whose name I inadvertently neglected to note down; but as his practical knowledge of masonry was of the greatest service to me while investigating the round tower and other ruins of Monasterboice, I feel myself called on to acknowledge the assistance which I derived from him.

I may remark, in the first place, that we observed indisputable evidence that the *doorway* of the Monasterboice tower *is an insertion*;—in other words, that the doorway had been built *to the wall* inclosing it, and not the wall built to the doorway, as would have been the case had the latter been an original structure. Among other evidences, I found that an angle of one of the stones of the doorway, on its inner side, and near the bottom, had been deeply cut out, so as to fit over, or overlap, a large projecting stone belonging to the adjoining portion of the wall. The doorway is of sandstone, and the tower of hard silurian schist. But besides this difference, any one might be led to suspect, from the imperfect way the stones of both parts are respectively bonded together, that the doorway is an after-erection: even the figure of it in Dr. Petrie's "Ecclesiastical Architecture of Ireland," p. 405, is of this tendency. It therefore only needed some positive evidence to convert a suspicion, which simultaneously occurred to the gentleman who was with me and myself, into a certainty; and this was afforded by the overlap above noticed, for no sooner had I pointed it out to my fellow-traveller than he declared that a more conclusive proof as to the entire doorway being a *patch* could not be expected.

Having long leaned to the opinion that the round towers of Ireland are of Pagan origin, contrary to the view so ably and fairly maintained by Dr. Petrie (a view which I am sorry to say has become of late intolerant among some of its advocates*), I was induced to extend my excursion to Donoughmore, near Navin, with the object of examining its round tower; the door entrance of which, it is well known, is distinguished from all others in Ireland by having on its arch a rude *alto-rilievo* figure of the Crucifixion. With this exception, the Donoughmore doorway is identical in style, ornamentation, and material, with that of the Monasterboice tower. Now, I hold that, as the doorway of the latter building is an insertion, the Donoughmore one must also have been inserted; and it necessarily follows that the figure of the crucifix, which is an integral portion of the doorway, must equally be considered in the same light. It is doubtful that the Donoughmore tower affords the same positive evidence which I observed at Monasterboice; as not only the *doorway*, but (unlike what is observed in the edifice of the latter place) the *wall*, for a *yard or so on each side of it*, consists of freestone, while the tower itself is of limestone. In Dr. Petrie's figure of this doorway, given in p. 407 of the "Prize Essay" already referred to, *all the parts* represented are of sandstone. The limestone does not come in for some distance on each side of the entrance. It comes in, however, immediately above the large block on which the upper half of the Crucifixion is sculptured. But in this place the limestone blocks are so broken and *imperfectly joined to the subjacent sandstone blocks*, as, if not amounting to a positive demonstration, to be at least *strongly suggestive of a patch*. With this exception, I admit that the insertion has been cleverly managed.

It was fortunate that I went to Monasterboice before going to Donoughmore; otherwise, I admit, I should not have expressed myself so strongly on this point. I fully appreciate the evidence which appears to have led Dr. Petrie and others to conclude that the round tower of Donoughmore and its entrance are contemporaneous; but the important fact stated in connexion with the Monasterboice tower completely destroys, in my mind, the assumed contemporaneity. The Donoughmore doorway and its immediate surroundings may be of a Mediæval age; but I contend that the edifice to which it belongs must be regarded as considerably older.* Some other round towers (Timahoe, Kildare, Brechin in Scotland, &c.), I strongly suspect, will have to be placed in the same category.

At present I am under the necessity of reserving all the evidences which have fallen under my notice bearing on this particular point, as well as on the pre-Christian antiquity of Irish round towers in general; but I purpose returning to these subjects on some other occasion. My object just now is to make a few remarks on an extremely interesting question, lately mooted in your valuable columns, connected with the mysterious megalithic monuments of New Grange and Dowth, near the Boyne, within a few miles of Monasterboice, and an equally short distance from Drogheda. In answer to the Rev. Mr. Graves's statement, that "Irish archæologists are well aware that there is not a vestige of an inscription (though there are many rude carvings) on any stone, now visible, in or about the mound of New Grange,"† you observe, as one reason why they have not been noticed of late, that "it may be that during the last fifty to a hundred years, or since the passage was opened and the incisions exposed to the influence of the air, they may have all scaled off."‡

Having carefully examined the incised figures occurring on the massive blocks and flags (formed of a light-coloured, fine-grained sandstone) in both caves, I feel myself called on to state that I saw nothing materially different from those represented by Sir William Wilde, in his "Boyne and the Blackwater;" and I doubt very much that any such figures have become effaced by atmospheric or other action since the reputed discovery of the caves. The figures are so fresh that it can readily be seen they have been produced by a small pointed instrument. But what is the strongest proof in my mind as to the surface of the stones having undergone little or no scaling off, is that some of the stones are marked with ice-scratches and furrows, such as must have been on them before they were removed from their natural site. The stones are what geologists call glaciated blocks.

Taking various circumstances into consideration, it appears to me that the "traces of letters" and "symbolic characters," observed by Vallancey and others, do still exist; but it must also be admitted that they are nothing more than the "rude carvings," so called by Mr. Graves,—the incised spirals, circles, zigzags, lozenges, runiforms, and other figures, with which all who have examined the caves are familiar. It is Vallancey's interpretations, if they were intended for these incised characters, which may be justly disputed. As to their true meaning, this is a question which may be left in the hands of those able men who are now studying their analogues at Lochgilphead (where there are acres of rock-surfaces covered with them), also in Northumberland, Kerry, and other places. Among these writers I am much gratified to see the name of my old friend and fellow-labourer in geology, Mr. Tate, of Alnwick.

You will, Mr. Editor, I feel assured, excuse these last remarks, referring as they do to structures so singularly resembling in their shape the cruciform cave temples of Salsette, near Bombay, and others in Egypt. The latter, however, have a covering of solid rock; whereas those of the Boyne are each covered with a vast mound of artificially piled-up gravel (eskar drift). In addition to its megalithic subterranean chamber, the New Grange mound has a flattened summit, circumscribed by a large rath-like circle, with a small one in the centre; while there still remain at its base several large monoliths, evidently part of a circle which formerly surrounded the entire mound. The entrance, truly cyclopean in style, has a threshold formed of one or two enormous blocks (I forget the number, but if two, they are placed end to end), lying lengthways, of hard silurian schist, the front of which is crowded with large mysterious incised spirals, looking like mere ornamentation, and almost as sharply defined as on the day they were cut.

Instead of being sepulchral, as some imagine, I cannot but regard the Boyne edifices, as

---

* A few months ago, the editor of the *Gentleman's Magazine* refused to insert a paper, by Mr. Brash (one of the ablest opponents of Dr. Petrie's view), in opposition to the opinion advocated on this subject in some able articles on the ancient architecture of Ireland, now in course of publication in its pages.—W. K.

* The Donoughmore tower, in addition to some important repairs which it has undergone, has been furnished with a new cap: besides, from the absence of the four top windows, usual to such structures, I strongly suspect that this tower is now considerably short of its original height.

† See *Builder*, Oct. 15, p. 752. ‡ *Ibid.*

having been erected for religious purposes,—as caves, wherein Druid priests performed their mystic rites. The huge stone basins (one of granite, one of sandstone, and another, broken, apparently of schist) in the three recesses (devoted to tri-theolatry ?), terminating the long entrance-passage in the New Grange mound, may have been used for sacrificial or baptismal purposes (Tertullian). The incised branch-like figure* in the western recess reminds me of the lines by the Druidical bard, Taliesin,—

> "I am acquainted with every sprig
> In the cave of the arch-diviner."

Ireland is classical ground for archaic edifices: her cromlechs, pillar-stones, round towers, mound-covered temples, raths, stone fortresses, primitive pelasgic-styled Christian oratories, and Mediæval crosses, are unsurpassed in number, or interest, by remains in any country of Europe. As monuments of her ancient renown, her sons may be justly proud of them. Let us hope that the growing intelligence of the age will, ere long, rescue them from their present unmerited neglect; and from, as I believe, a false and derogating chronology.† WILLIAM KING.

Behaont, near Galway.

FROM PARIS.

IN most of the new quarters in Paris the habitations replacing those demolished are first-class residences, and only approachable by persons in comfortable circumstances. An exception, however, occurs near the Boulevart Mazas, between the Rue de Châlon and the new Avenue Daumesnil (formerly the Avenue de Vincennes), where the houses are being constructed after a less sumptuous model, and are consequently within reach of the working classes.

The Avenue Daumesnil, stretching through the twelfth arrondissement, passes through the *rond-point* of Reuilly, descends towards the Porte de Picpus, opened on the new promenade lately added to the Bois de Vincennes. Here, also, modest dwellings are being erected suitable to the working classes. There being two stations close by, of the Chemin de Fer de Ceinture, the artisans inhabiting this quarter will have easy access to their *chantiers*.

The works of the new reservoir at Menilmontant have been very much advanced this year. This immense basin, to be supplied from the Dhuis, is to be divided into two stages. The upper basin, of semicircular form, will have its overflow level 354 ft. 4 in. above the level of the sea, and is to contain spring water. Its capacity will amount to 130,802 cubic yards, or 22,009,668 gallons: the depth of the water is to be 16 ft. 5 in., and the reservoir arched over by spans of 18 ft. openings, composed of a double row of bricks laid on the flat, and grouted with mortar and hydraulic cement. At the key of the arch it will be as slender as possible, and a covering of earth and a grassplot will keep the interior always cool. The second reservoir, the highest level of which will be 26 ft. 3 in. lower than the upper one, is to receive the water of the Marne, raised by engines which are now being mounted at St. Maur. These are to be turbines of about 400-horse power. Two conduits of cast-iron, about 9,296 yards long each, will convey the water from the St. Maur works to the Menilmontant reservoirs. These tubes start from Joinville le Pont, cross the Bois de Vincennes, and continue along the Avenue de Vincennes and the *route militaire* till they reach the grand reservoir.

The Menilmontant basins are to send, by means of an engine of 15 horse power, a supply of water to other reservoirs now in course of construction at Belleville. These are on the same plan as those first described, but of smaller dimensions.

According to the new project of the fresh water supply to Paris, there are to be furnished 44,019,335 gallons of water every 24 hours.

The supply canal of the Dhuis, now in course of construction, alone will yield and deliver at the maximum level of 354 ft. 4 in. above the sea, 8,803,867 gallons per 24 hours.

The total length of this supply canal is 83 miles 537 yards, and is for the most part in cutting. The section presented by the portion in masonry is egg-shaped, 5 ft. 9 in. in height under the key, and 4 ft. 7 in. greatest width. The pipes through which the water is forced are 3 ft. 3⅜ in. internal diameter.

The ancient church of St. Mary has been almost thoroughly restored. The nave, transept, choir, side aisles, and chapels have been all renovated and cleaned, so that this church may now take a third rank among the finest in Paris. Built in the fifteenth century, on the site of the ancient chapel of St. Peter, known since the seventh century, it contains numerous fine paintings by Coypel, Carl Van Loo, &c., and some admirable specimens of painted glass by Vinaigrier and de Parray. The choir is in the style of Louis XIV., and was decorated by the brothers Slodtz. It was the Curé de Saint Merry, J. Thomas, who wrote to the Pope John XXII. the curious letter addressed after the execution of Jourdain de l'Isle, the Pope's nephew, convicted of felony. The letter ran thus:—"Very sacred father,—As soon as I was informed that the husband of your niece was about to be executed, I assembled our chapter and represented that we ought to profit by this opportunity of proving to you our very respectful attachment and very profound veneration. No sooner was he hanged than we proceeded in great illuminated procession to take him from the gallows, and we bore him to our church, where he was interred honourably and gratis [*sic*]. Sacred father, we continue to demand very humbly your holy and paternal benediction."*

ÆSTHETICS IN ART.†

ÆSTHETICS, in relation to those departments of art which are comprehended by the generic term architecture, may be described as the effect of a work of art on the mind of its beholder. The nature of this effect must be variable, but the æsthetical condition obtains whenever it is produced through the medium of the observer's perception. There are three elements concerned in the production of the æsthetical condition. 1st. The art embodied in its work, and possessing a power to affect the mind of its beholder; 2nd. The mind of the beholder endowed with a faculty of perception, in greater or less degree of development; and, 3rd, the sympathy of the power in the art with the faculty in the man, or, in other words, that adaptation of the one to the other which renders an intercommunication possible. At first sight this division of the subject may appear more imaginative then essential; but, if I mistake not, further consideration will change the judgment. It cannot be doubted that there have been epochs in the history of art when the power embodied in certain of its works has been both unfelt and unrecognised by the mass of men who witnessed them. The art-sense of the time was not adequate to their appreciation. Though true chords were struck, their music sounded discordantly to ears incapable of harmony. But succeeding generations of men have inherited mind in a higher degree of development, and hence the discovery of powerfulness in works which were no less powerful when their unenlightened ancestors failed to feel their influence. And not only is the faculty of perception necessary to æsthesis, but that faculty must be subjected to a process of education before its full functions can be brought into relation with the external world. And this is true, not only in respect to the higher qualities of taste and discrimination, but to the act of visual perception itself, independent of its more subtle properties. For example, a person born blind, but afterwards receiving the power of sight, is unable to realise the pictures formed on the retina of his eye. Solidity, distance, and even form and colour, cannot be ascertained by the sense new to him, until the course of training to which it is subjected by his other senses has resulted in its mature development. But not only may the æsthetical state be rendered impossible by a defect in the perceptive faculty of the beholder; it will fail also if the work of art be imperfect,—if the significance it bears is too vague or too confused for the production of a definite impression. There must, therefore, be a sympathy or affinity between the faculty of perception and that which strives to operate upon it, and it is this sympathy which I have referred to as the third element in æsthetics. From these considerations it will be evident that the study of æsthetics (properly so called) involves, on the one hand, a close scrutiny of the progress of art from the earliest traces of its existence to the last step in its advancement, and, on the other, a methodical investigation of the growth of intellect; and the parallelism of these two progressive developments will determine the relations which have subsisted between them at different periods of their course, and the record of these relations will be the history of æsthetics. The necessities of such a task must obviously far exceed the limits of a paper, and I shall content myself on the present occasion with the suggestion of a method by which I conceive the science of æsthetics may be most readily and profitably investigated. At the threshold of our inquiry it will be important for us to form a passing estimate of the two principal methods in which art makes the appeal to our sensibilities necessary to æsthesis—the *imitative* and the *suggestive*. Their distinctive qualities will be best characterised by comparison. Suppose, first, the case of a painting designed to portray some object peculiar to civilised life—say, for example, a steam-carriage. Let the picture be simply a correct imitation of the form and colour of the object depicted. What would be the æsthetical value,—or, in other words, the effect,—of such a work of art on the mind of an uncivilized spectator, one who had never seen the original of the portraiture? It is easy to see that he must utterly fail to comprehend the nature of the representation before him. But now suppose that, instead of merely imitating his view of the steam-carriage before him, the artist contrived, by the peculiar treatment of his subject and the management of its accessories, to suggest or imply the property of locomotion. The whole effect would be changed. The man who in the former case looked on the imitative portraiture, and wondered at its strangeness, would, in the latter instance, realise the idea of motion *suggested*; and, combining the idea so realised with that which before only excited his surprise, he would obtain the knowledge of a new locomotive vehicle. Or, again, to take an example from the higher functions of art, suppose the case of a painter seeking to imply the spirituality of a supernatural being under the semblance of a human body, and it will be evident that all that is superadded to the portraiture of a man to make it awaken the idea of divinity in the mind of the beholder must be *suggestive*, or, in other words, powerful to call into action the imaginative faculties of his intellect. There could be no original to imitate, yet there would be a reality to suggest. The work of suggestion may be imperfectly performed, or the observer incapable of imagination, and the æsthetic effect consequently impaired or altogether impossible; but the task of the artist, in whatever degree it is accomplished, must necessarily be something more than mere imitation. Nor is it essential to the perfection of a suggestive work of art that the material element (or, more correctly, the imitative part) of its composition should be strictly accurate. It not unfrequently happens, as in many works of the Italian and other schools of painting, that the objects forming the material of a picture are false to every known fact of the classes from which they are taken; or, as in some Mediæval works, so conventionally treated as to become non-natural; and yet, in spite of the anomaly, a lesson powerful enough to enlighten and influence the whole mental and moral organism of the beholder may be suggested. And, in virtue of the difference which exists between a purely imitative and a suggestive work of art, the latter has the advantage of being independent of the experience of the beholder (as we have seen in the case of a portrait of a steam-carriage); whilst the former can produce no æsthetical effect, but remains unintelligible to the person who is unacquainted with its original. The inexperienced observer in the presence of a mere portraiture of unknown objects is amazed, but uninstructed. He has something to learn concerning them which a purely mistaken art is incompetent to teach him. There can be little doubt, therefore, that the higher class of art-teaching must be accomplished by a method which can do something above and beyond the mere transcription of natural objects, and if I mistake not the method that shall be found capable of such an enterprise will not only employ the materials nature has provided for the handicraft of her disciples, but search out the processes that are employed in her studio, and embody them there as the govern-

* Some have taken this branch-like figure for a rune; others, from its being pinnated, for a representation of a palm-leaf; but to me it appears more likely to be a figure of some species of a willow, or of an ash.

† Of course, the reader will understand that I here refer chiefly to the round towers, and other Pagan monuments.—W. K.

* See Sainte-Foix, Essais historiques sur Paris.

† From a paper by Mr. J. Mortimer Granville, read at the Bristol Society of Architects on the 2nd instant.

ing principles of its own practice. . . . The system, then, gentlemen, to which I propose inviting your attention this evening is founded on the hypotheses,—1st, that there exists a distinct series of elementary forms or symbols of art which have definite significances; 2nd, that these forms or symbols are so constituted that they will combine amongst themselves in definite formulæ, and in these only; and, 3rd, that the æsthetical condition will not obtain unless the property of provoking perception (which is located in the work of art itself), is adapted to the special faculty of perception in the observer. . . . . And now, gentlemen, I must take leave to remark that I believe the great necessity of art in the present day is scientific inquiry. For want of it men set about their work with little appreciation of the difficulties to be encountered, the obstacles to be overcome, and the ends to be attained by them. A general desire to please, or a devoted allegiance to some particular style, is all that represents in art those well-ordered processes and preconceived purposes which guide the experimenter in the science of chemistry. And yet art is a natural system. Nature is not only the example, but the governor, of its practice; and the laws which are embodied in her achivements are no less the constituents of a natural science than are the power and affinities she has provided for the direction of the chemist. They must both be sought in the same way, and realised as rigorously in the daily exercise of their respective philosophies. The laws which govern the designer are no less inviolable than are those which determine the practice of a Liebig or a Faraday, whether his task be analytical or synthetical research amidst the mysteries which surround him. The purpose I have had in view on the present occasion has been to claim for æsthetics the character of a natural science, and to assert for it the prerogative of governance in relation to every work of the true artist, whether architecture (properly so called), sculpture, or painting be his speciality, for the æstheticism of all are identical. The limits of time at my disposal have not, indeed, been sufficient for the statement of my theory and the exposition of its elements; but I regret this the less because, as regards the latter portion of the task at least, what I should have imperfectly attempted is already accomplished in the works on your bookshelves. The want of art-literature in the present day is not so much new information as more orderly treatment of that we have already attained, a better development of natural laws, a less conventional appeal to the customs of art-work as infallible, and a more patient and generalising research amidst the significance of all that is significant, and the powerfulness of all that is powerful, a more complete separation of the idea of portraiture from that of suggestive symbolism, and the assignment to each of its proper sphere in the art-field. The recognition of definite natural formulæ, definite principles of combination, and definite æsthetical effects, inseparably attached to the processes by which they are produced, the studious scrutiny not only of Nature's works, but her methods and mannerisms, and the embodiment of all the information we obtain in the practice of an art which shall be no mere mimicry of the myriad objects in her realm of power and loveliness, but, as it were, an extension of her own creation in the lesser but vastly important domain which has been conceded to the handicraft of her disciples;—a high, nay, even a God-like, because a God-following, task to work out a world of mysteries in the path which the Creator of all things has provided for the progressive development of the being—Man—who was created in His image. If it be a truth that the recognition of great significance and the discovery of lofty motive in an enterprise afford the strongest incentive to its accomplishment, let us admit that æsthetics in relation to art constitute a natural science, and that as such the laws which govern it are promulgated from the same oracle that gave forth the physiological principles of our own existence.

Dimensions of Churches.—"Clericus" has made the mistake of adding 100 ft. to the "width of the nave" of the church of Holy Trinity, Hull. The clear width is 72 ft., and 96 ft. across the transepts, falling far short of the 110 ft. width of both nave and chancel with aisles, and 154 ft. across the transepts of St. Nicholas' Church at Great Yarmouth.—J. P. S.

ABURY AND STANTON DREW.*

The most simple form of Celtic monuments is the Maen-hir, or Long-stone—called also Peulvan, or stone pillar. This is doubtless the earliest as it is the simplest form of monument, and was erected to commemorate a victory, or to mark a boundary, or to denote the resting-place of some person of rank. These single stones are found in all countries, and we have notices of them in Holy Writ. Many of them now may be only the Holy Writ. Many of them now may be only the remains of more extensive monuments which were destroyed when Christianity overthrew the ancient Paganism, for the decrees of Councils of the Church were directed against such like monuments. A.D. 452 the Council of Arles, A.D. 567 the Council of Toledo, threaten with excommunication any bishop who shall not use his influence to destroy all objects of idolatry, among which stones are enumerated. Chilperic in his charters enjoins the destruction of the stone monuments which cover the land, and the Anglo-Saxon laws forbid the worship of stones (Canons of Edgar, ch. 16; also Saec. Laws of Canute, c. 5). These stones afterwards were converted in some cases to Christian purposes, and have been used as monumental stones. Many exist in this island with the names of persons of British or Romano-British extraction carved upon them, and a very remarkable monument of this kind exists near Joinville, in the department of the Meuse, on which is sculptured VIROMARVS ISTALIF, *i.e.*, Viromagus, son of Istalius, which perhaps commemorates a Gaulish chief subject to the Roman power (see Akerman's Archæological Index, p. 18). A Maen-hir stands in the parish of St. Briavel's, in Gloucestershire; and at Trelech, in Monmouthshire, are three, which are said to mark the spots where three chieftains fell in the battle with Harold, who defeated the Welsh in that county. The next monument is the Dolmen, or Trilith, which consists of two upright stones and one placed upon them. These are supposed for the most part to be the remains of ancient sepulchres, which have been covered with earth originally, but from which for various reasons the earth is now removed. There are gigantic trioliths which compose one of the ovals at Stonehenge; but these are different from the ordinary trilith, which seems to have been sepulchral. Cromlechs consist of three or more upright stones, which are capped by a fourth. They are arranged as follows by Sir Gardner Wilkinson (see Rock Basins of Dartmoor, *Journal of British Archæological Association*, 1860, p. 116):—1. The cromlech proper, or three-pillared cromlech, supported on three stones. 2. The four-pillared or cist-cromlech, supported on four slabs, enclosing a square space like a cist or chest. 3. The many-pillared cromlech, with more than four slabs of piers, as Trevethy and Zennor Quoits in Cornwall. 4. The chambered cromlech, with high-walled sides composed of several upright slabs (the Dolmen of France), sometimes with several large covering stones. 5. The subterraneous chamber, like the hollow tumulus; but this is not properly a cromlech.

These cromlechs are probably all sepulchral. The covering stone is generally convex on the upper surface, or sloping at one end, whence the name of cromlech is supposed to be derived,—*crom* signifying bowed or bent, and *llech* a slab. For a particular account of cromlechs I must refer to Mr. Lukis's paper in the *Archæologia*, vol. xxxv., p. 232. The next description of megalithic monument is the stone circle. Of these there are many in our island. We have, first, single circles of stones, as at Penrith (Long Meg and her daughters), and at Arbor Lowe, in Derbyshire, which latter is a single circle, surrounded by a trench having two entrances. Three stones remain in the centre of the circle. Single stone circles are found on Dartmoor and in Cumberland, and other localities of our island. On Dartmoor they are connected with long straight avenues of stones. In other instances these avenues are winding, and pass through the stone circle, giving the appearance of a serpent passing through a circle, as at Abury, or two serpents issuing out of a circle, as at Stanton Drew. Hence they have been called Dracontia, and supposed to indicate the worship of the serpent. This subject has been dwelt upon at considerable length by the Rev. J. Bathurst Deane, in his work on serpent worship. Of Megaliths, the most magnificent in Britain is at Abury, Wilts; the most extensive that of Shap, Westmoreland. Stanton Drew is smaller. The megaliths on Dartmoor are also smaller, but more perfect. All these vary in actual figure, but agree in general analogy. Arberlow, in Derbyshire, has a mound and vallum exactly like to that at Abury. Stanton Drew is considered by Mr. B. Deane as the second dracontium in order of beauty now extant in England. He says the "plan of it is of the ophite hierogram, where two serpents emerge from the circle." Abury he regards as a single serpent, and older than Stanton Drew. On Dartmoor the remains are parallelitha, the lines are straight, and the temples in pairs. At Merivale Bridge, 4 miles from Tavistock, on the Morton Hampstead-road, is a remarkable group, consisting of four temples, viz., two parallelitha and two circles. Of the circular temples only one remains entire, but the central obelisk of the others is still standing, and measures above 10 ft. in height. The circle is formed by eight stones, and is about 18 yards in diameter. Between this and the road are the dracontia, forming a pair of parallel avenues, running east and west, and 105 ft. apart. The average width of the avenues is 3½ ft. The stones are generally 2 ft. high, though some are much higher. The longest avenue is 1,143 ft. It has an oval in the centre, and had a circle at each end, which are now scarcely traceable. The shortest avenue is 792 ft., and terminates in a circle. The first of these Mr. B. Deane considers to be a dracontium of the same order as Stanton Drew, only the avenues are straight. There are other stone structures on Dartmoor of the same description, but not so extensive. On the brook side below Black Tor, are two avenues parallel to each other, running east and west, which may be traced for 300 ft. and 180 ft. respectively. They are 40 ft. apart, and each is terminated at the east end by a circle, 30 ft. in diameter, inclosing a cairn. The stones average the same height as those at Merivale. Similar avenues, but running north and south, occur near Gidleigh Common, of which the pillars are 3½ ft. high, and triangular. They may be traced for 432 ft. and 123 ft. respectively. Many other monuments of the same kind are scattered over the moor.

Shap, Westmoreland.—The stones are not to be compared for grandeur with those of Abury, and the appearance is less interesting than Stanton Drew, but the avenue of Shap was a work of great labour and extent. The avenue is supposed to continue in a sinuous course seven miles. Here, as in all the British structures of the same kind, there are but two rows of stones; these may now be traced at intervals for nearly two miles. They begin at about half a mile to the south of the village of Shap. This extremity of the avenue seems to have been the head of the serpent (says Mr. B. Deane). It is called a circle, but in reality is only a wedge-like area, having the angles of the base rounded off, and the base itself bounded by a slightly-curved line, its vertex opening into the parallelithon. The avenue is said to have terminated at Moor Dovey, near Banton, seven miles from Shap, but only two miles can be satisfactorily traced; there does not seem to have been a great circle as at Abury.

Carnac in Brittany.—This differs in some respects from the megalithic structures in Great Britain, but still all preserve a general analogy, sufficient, as Mr. B. Deane thinks, to point out a kindred religion. The British dracontia have only two parallel rows of stones, whereas Carnac has eleven. But the same concomitant tumuli and cromlechs decorate all. The serpentine sinuosities are the same in the structures of both countries, but that at Carnac is intersected by two curvilinear areas, neither of which can be called in strict propriety a circle. The great Celtic monument at Carnac, known as the "Stones of Carnac," is eight miles in length. (See *Archæologia*, vol. xxv., p. 202.)

Abury.—The most ancient and most magnificent of the megalithic structures in our island is Abury. This is in Wiltshire, and the village of Abury or Avebury is situate on the line of the turnpike road between London and Bath, through Devizes, but lies at some distance from it, and is four miles west from Marlborough. The first person who examined it with attention, and who has left any particular record of it, is John Aubrey. Leland only makes this scanty allusion: "Kenet risith N.N.W. at Selbirihill bottom, whereby hath been camps and sepulchres of men of war, as at Aibyri, a mile of, and in divers places of the plain." Camden does not seem to have been aware of its exist-

* From a paper by the Rev. Prebendary Scarth, on "Some of the Megalithic Remains of Great Britain, especially the large Circles of Abury, Stonehenge, and Stanton Drew," read at a meeting of the Bath Literary and Philosophical Society.

ence. Aubrey first met with it in a hunting excursion, when the chase led through Abury village, "where," says he, "I was wonderfully surprised at the sight of those vast stones, of which I had never heard before, as also at the mighty bank and graffe about it; I observed in the enclosure some segments of rude circles, made with these stones. A.D. 1663, King Charles II. visited Abury, under the guidance of Aubrey, on his way to Bath, who "shewed him that stupendous antiquity, with the view whereof, he and H.R.H. the Duke of York were very well pleased." The king commanded Aubrey to write a description of it, which is extant. He says, "I take this old ill-shaped monument to be the greatest, most considerable, and the least ruinated of any of this kind in our British isle." It is environed with an extraordinary great vallum, within which is a graffe of a depth and breadth proportionable to it. Round about the graffe are pitched on end huge stones, as big, or rather bigger, than those at Stonehenge, but rude and unhewn as they are drawn out of the earth. Within this circumvallation are remaining segments of two sacellæ, and their ruins are not unlike Ariadne's crown. This monument does so much exceed in greatness the so renowned Stonehenge, as a cathedral does a parish church, so that by its grandeur one might presume it to have been an arch-temple of the Druids. It is situate in the country of the stones called Grey Wethers, of which sort of stones both this antiquity and that of Stonehenge were built. From the south entrance runs a solemn walk of stones, pitched on end, about 7 ft. high, which goes as far as Kynet, a measured mile from Abury, and from Kynet it turns with a right angle eastward, crossing the river, and ascends up the hill to another monument of the same kind. The distance of the stones in the walk, and the breadth of it, are much about the distance of a noble walk of trees of that length, and very probably this walk was made for processions. Within the circumference or borough of this monument is now the village of Abury: the houses are built of the frustums of those huge stones, which they invade with great sledges. These mighty stones may be broken in what part of them you please, without any great trouble, by making a fire on that line of the stone where you would have it to crack, and after the stone is well heated, draw over a line of cold water, and immediately give a knock with a smith's sledge, and it will break like the collets at the glass-house. The church is built of them, and the manor-house, and another fair house not far from that." The Beckhampton avenue escaped Aubrey's notice. Dr. Stukely, A.D. 1723, gave a detailed account of the plan upon which this wonderful megalithic structure is formed. He spent much time on the spot, surveyed it thoroughly, reckoned the stones then standing, those that were prostrate, and the hollow places indicating the sites of those that had been destroyed; and this he did, not only with the vallum, but in the avenues and the sanctuary (as it is called), on Kennett Hill. "When I frequented this place," he said, "which I did for some years together, to take an exact account of it, staying a fortnight at a time, I found out the entire work by degrees. The second time I was here an avenue was a new amusement, the third year another; so that at length I discovered the mystery of it which was, that the whole figure represented a snake transmitted through a circle. This is an hieroglyphic or symbol of highest note and antiquity." (See Stukely, as quoted by W. Long, Esq., Wilts Mag., Jan., 1858, vol. iv., p. 323, Paper on Abury.) Within the large outer circle were two smaller ones, not concentric, each, according to Stukely, composed of thirty stones. Of the southern of these circles two stones only remain erect, and three prostrate. Three recumbent stones (says Mr. Long) marked in early impressions of Sir R. C. Hoare's survey of 1812, were removed between that year and 1819. Of the northern circle three stones are now erect and one prostrate: one which was standing when Sir R. C. Hoare described Abury has since been broken up. Within each of these circles Stukely thinks there was a concentric circle of twelve stones. Within the northern of these circles, in its centre, were three very large stones, which formed the adytum, or cove of the temple, as Stukely termed it. The altar-stone is supposed to have been placed in the centre of these three, but to have been removed, as the place for it seemed to have been filled with rubbish (see Mr. Long's Paper, p. 325). In the centre of the southern inner circle of twelve stones, was one stone, described by Stukely as of circular form at the base, of vast bulk, 21 ft. long by 8 ft. 9 in. dia meter, and when standing, higher than the rest. Stukely thought it was the kibla, ambre, or central obelisk, of the temple. Nothing now remains of it.

Stanton Drew is one of the most interesting megalithic monuments of this island, and probably one of the most ancient. It is situate in the county of Somerset, about 7 miles south of Bristol, in the valley of the Chew, and near that river, not far from the range of hills called Dundry, and is overlooked by the portion of that hill called Maesknoll, on which the camp is situate. It lies to the south of the line of the Wansdyke, which can be traced through Wilts to Hampton Down, south of Bath, and on to Stantonbury camp, and by Compton Dando to Maesknoll. It was, therefore, situate within the line of the supposed Belgic boundary. The three great megalithic monuments of the south and west of England are Stonehenge, Abury, and Stanton Drew; and of these Stanton Drew is the smallest. It consists of three stone circles, or more properly a central oval and two small circles, which seem to have been connected with it by stone avenues, and give the appearance of two serpents passing out of a central inclosure. Such it has been taken to represent. The first writer by whom it is mentioned is John Aubrey, A.D. 1664, who says that he was told that the number of stones were much diminished within a few years of his time; and Dr. Stukely speaks of a "late tenant who, for covetousness of the little space of ground they stood upon, buried them for the most part in the ground." Mr. Long states in his interesting memoir of Stanton Drew, in the *Archæological Journal*, vol. xv., p. 200, it does not appear that since Stukely's visit, A.D. 1723, a single stone has been removed, and we trust that the day is past when historical monuments such as these shall suffer wanton destruction. John Aubrey first brought Abury and Stanton Drew into notice, the former A.D. 1648, the latter in 1664. Dr. Musgrave, in his "Belgium Britannicum," vol. i., p. 206, A.D. 1719, gives an account of Stanton Drew, and illustrates it by an accurate plate of the structure as it then stood. Keysler, in his "Antiquitates Septentrionales," 1720, gives a short account of Stanton Drew; but none of these writers appear to have been aware of the existence of the cove, or of the circle which is near it, as their descriptions are confined to the portions of the structure in the field near the river. Collinson briefly describes Stanton Drew in his history of Somerset, published A.D. 1791; and Seyer, in his history of Bristol, A.D. 1821, gives a more detailed account, with measurements of the stones, and lithographic drawings. The best plan of Stanton Drew is that given by Sir R. C. Hoare in his modern Wilts, from a survey by Mr. Crocker. The cove is situate a little to the south of the parish church, and is formed of three stones standing in an orchard. The two side stones are still standing, but that which formed the back is fallen down. These three stones are 18 in. thick, and the respective lengths from 10 ft. to 14 ft. The cove is 10 ft. wide, and about 8 ft. deep, and opens to the S.E. The first circle is distant 157 yards from this cove, in an easterly direction. The number of stones which originally comprised it appears to have been twelve, and the diameter of the circle, according to Mr. Crocker, is 129 ft. There are now remaining in the orchard, in which it is partly situate, six stones, and three in the adjoining field, and one under the wall, which separates the orchard from the field, making ten in all. One hundred and fifty yards from this circle, in a N.E. direction, is the great circle, the diameter of which, according to Mr. Crocker's measurement, is from east to west, 345 ft., and from north to south, 378 ft. It is, therefore, strictly speaking, an ellipse with the longer axis from north to south. The number of stones remaining is fourteen, of which three only are standing; others are said to be beneath the surface. The tallest of the standing stones is 7½ ft. high, and about 6 ft. thick. They are all of a very rude appearance. Eastward from the great circle, at a distance of 150 ft., is a circle of eight stones; its diameter is 96 ft.; four only are now upright. Adjoining this circle on the east and south are seven scattered stones. The general opinion respecting these stones (says Mr. Long) is, that they formed a sharply curving avenue, which connected the circle of eight stones with the large circle. From the mention made by Aubrey that the number of the stones had diminished much within a few years of his time, we may conjecture that the corresponding avenue which led to the great circle from the other circle in the orchard, has been carried away or buried, and thus we have the structure at present in an imperfect state. The stones appear to have been procured near the spot where they now stand, from a stratum about 6 feet under the surface. Most of the blocks are stated to be composed of conglomerate, which has been slightly coloured by red oxide of iron, but there are others of a much finer grain. For a fuller account of the geology of the district, I must refer to Mr. Long's paper in the *Archæological Journal*, which will be found to contain, as I think, nearly all that can be said on the subject of Stanton Drew, and we have reason to feel thankful that in the present day gentlemen of learning, ability, and leisure can be found to undertake the elucidation of these interesting monuments.

Stonehenge.—The remarks of Mr. Scarth on Stonehenge, were similar to those made by him when he conducted the excursion in connexion with the British Association thither, and which were reported in our columns at the time. Having spoken of Stonehenge at some length, the rev. gentleman thus concluded his paper:—We have now traced the megalithic monument from the simple stone, or Maen-hir, to the Dolmen or Cromlech, or stone chamber, and to the stone circle simple, and with the avenue also, and we have seen its magnitude and extent, and how it has at length assumed the more finished form in the circle at Stonehenge. We have considered the curved avenue at Stanton Drew and Abury, as well as the straight lines on Dartmoor. These megalithic structures are not confined to this country alone, or to Brittany, but cromlechs are frequent in parts of India and in other countries, and allusion seems to be made to them by many classical writers, as may be seen in Mr. Deane's chapter on Serpent Temples (see Serpent Worship, p. 398 and following). It is not my purpose, even if time would allow, to follow the conjectures which have been hazarded on this subject, or to submit any of my own. I will only say that in these circles and other megalithic structures, we have evidences of mechanical skill which raise our ideas of the state of society in which they were erected. We have evidences of united labour and united effort in an age when the habits of life were necessarily simple, and the knowledge of constructive arts very rude. But whether we regard these avenues and stone circles as sacred or consecrated localities, or as hypæthral temples, or as dracontia, or as the seats of justice and administration of the laws, we have monuments of a very remote age, and of a very simple and primitive people; and if we would preserve the memorials of our national progress, and treasure up its historical records, we should carefully preserve these records of its primæval inhabitants.

THE METROPOLITAN SEWAGE QUESTION.

This subject is at the present moment exciting no little interest and attention, and statements and opinions given in the *Builder* long ago are being repeated, and will, we hope, be acted on.

A special Court of Common Council of the city of London was held on Saturday, at the Mansion House, for the purpose of taking into consideration a report of the Corn, Coal, and Finance Committee of the corporation upon the subject of the utilization of the sewage of the metropolis, the matter having been referred to them upon the requisition of a public meeting of inhabitants of the City.

The Lord Mayor presided, for the first time since his installation to that office.

The report that was the subject of the meeting had already been made public. It was to the effect that the committee, fully aware of the great importance of the subject, not only to the ratepayers, but to all classes of the community, had attentively considered it in all its bearings, and had been favoured with the assistance and advice of Lord Robert Montagu, M.P., and Dr. Brady, M.P., both of whom had acted as chairmen of committees in the House of Commons upon the utilization of the metropolitan sewage, and they had collected all the information in their power: the result they had arrived at upon the present state of knowledge of the subject was, that nothing should be done at present, but further and thorough investigation should be instituted without further delay, either with the sanction of Parliament or of the Imperial Government.

After some discussion, the report was unanimously agreed to; after which it was moved by Mr. Lawley that the committee should be instructed to take the necessary steps to obtain a Royal Commission, and this led to some further discussion. The Common Serjeant, who was appealed to in the course of the debate, expressed his opinion that it would not be prudent for the corporation to apply to the Government to issue a royal commission, as they had no power to control the scope of such a commission, and the result might be to materially affect the principle of local self-government. Mr. Lawley upon this withdrew his motion, and another resolution empowering the committee to confer with the Government, and to take any other steps they might deem advisable in the matter, was agreed to, after which the court adjourned.

In the report under discussion, the reporters say:—

"Your committee find that two systems of utilisation are advocated,—the one, that of large quantities poured from open carriers over grass exclusively, as at Edinburgh and Rugby; the other, that of moderate dressings of sewage, as applicable to all descriptions of crops, by the hose and jet, as at Cashobury Park, Watford, by the Earl of Essex; at King's Weston, Bristol, by Mr. Philip W. S. Miles, M.P.; and at Tiptree Hall, by Mr. Alderman Mechi.

Your committee are of opinion that the results obtained by Lord Essex, Mr. Miles, and Mr. Alderman Mechi, as well as by other witnesses examined by the two select committees of the House of Commons presided over by Lord Robert Montagu and Dr. Brady, prove that it is by careful and moderate dressings, applied by the hose and jet over large areas, and not by large applications flooded from open carriers over small areas, that the home supplies of food will be most increased by the utilisation of the metropolitan sewage, and that the farmers using that sewage will be best enabled to pay a fair price for the manure; and, having regard to the vast quantity of the metropolitan sewage, and that it will only be used in addition to the farmyard manure made on the land, your committee are of opinion that, to insure its being sold at its value, works of distribution must be laid down, so as to bring it within reach of a very extensive area, it having been stated by a competent witness before the select committee of the House of Commons, that it should not be less than from 500,000 to 600,000 acres. It would be difficult for any company proposing to utilise the sewage on its own lands to purchase or lease so extensive a tract of country; and, if it were possible, it would be contrary to public policy to make over to any company such a vast amount of manure for its own purposes, to the prejudice of the general body of farmers, thus creating a gigantic monopoly. Your committee are therefore of opinion that any company proposing to deal with the London sewage should simply be distributors of the manure to those who would utilise it.

Before, however, any concession be made, your committee would suggest that a further and more searching investigation should be undertaken into the whole of the schemes for the economic sewage utilisation, in order to avoid, as far as possible, all risk of error, and to secure for the best system and the most satisfactory plan such an amount of national confidence and support as shall insure not only the prompt and profitable utilisation of the metropolitan sewage, but that also of the other cities and towns of the United Kingdom."

The letter of Baron Liebig to Lord Montagu is appended to the report.

The Islington vestry had a special meeting on the subject of the utilization of the metropolitan sewage on Monday evening, when Mr. Bolton moved—"That this vestry having heard with surprise that the Metropolitan Board of Works intend to dispose of the metropolin sewage without previously affording opportunity for the consideration of the scheme they intend to select, hereby protests against such a course being taken, and requests the representatives of the parish at the Board to oppose the sale of the sewage until the public have had an opportunity of considering the intentions of the Board."

In doing so he entered at much length into the question, and criticised rather severely the conduct of the Metropolitan Board in dealing with the matter.

Other speakers followed, with equally strong language, deprecating what they regarded as hurry on the part of the Metropolitan Board; and urging the alleged advantages of Mr. Ellis's scheme over that of Messrs. Hope & Napier, which the Metropolitan Board were then on the eve of adopting. Others denied that there had been any hurry, the respective schemes having been for some time before the Board. An amendment disapproving of the disposal of the metropolitan sewage to Messrs. Hope & Napier, and requesting the representatives of the vestry at the Board not to support such measures until due care had been taken to ascertain whether the project of these gentlemen was practicable, and whether the terms they offered were the best that could be obtained, gave rise to an animated discussion of three hours' duration, at the end of which the amendment was put and lost, and the original motion was agreed to all but unanimously; and it was further resolved that a copy of the resolution be forwarded to the Metropolitan Board of Works.

The report of the Main Drainage Committee of the Metropolitan Board on the application of sewage at Croydon, Rugby, Carlisle, and Edinburgh, has been published. The information in it is not very precise. Towards the close of the report, they say:—

"The committee consider that the evidence they have collected will prove of assistance in arriving at a sound conclusion in reference to the sewage of London. At Croydon they saw that the operation was successful, though on a limited scale, and were informed that the results were remunerative. At Carlisle, where the only process was employed to prevent decomposition of the sewage, they learnt very curious statements of its collateral advantages. At Edinburgh they witnessed the beneficial result of many years' experience of the profitable application of sewage to sea-sand. Your committee were not able to ascertain, during their visits to these several places, the chymical composition of the sewage of any of them, or the precise quantity of sewage applied annually, or during a given time; still less did trustworthy experiments appear to have been made as to the quantity which could most advantageously be employed. The same uncertainty prevailed as to the amount of grass cut, or hay made, or cattle fed, upon either the sewaged land or that adjoining, obviously a most necessary element of comparison."

They were told at Rugby that an acre of the land irrigated with the sewage, originally worth 1*l.* 15s. per annum, might now be considered worth at least 3*l.* 10s., but the tenant doubted whether he benefited by the irrigation of his farm.

At Croydon they were told that 3,000 tons per acre per annum of excreta were derived from a population of about 17,000, and that a tenth of the 250 acres irrigated was under irrigation at one time, and that each acre was under treatment thirty-six days in the year. In about five hours the sewage flows over the land, and is entirely deodorized. In two days it flows off nearly tasteless, colourless, and inodorous. The greater portion of the farm is sown with Italian rye-grass, which requires resowing every three years, and appears to produce the largest results; but some parts are still in natural pasture. It is rented by the Croydon Local Board at 4*l.* per acre, and is sub-let to Mr. Marriage at 5*l.* per acre, so that the Local Board obtain an improved rent of 250*l.* per annum, which goes in reduction of their local rates. The committee could not ascertain the exact weight of grass produced.

At Carlisle they found that Mr. M'Dougall had just let 105 acres to a butcher, at a rental of 800*l.*, or a gross profit rental of 482*l.* Here, only, the decomposition of the sewage is prevented by chemical action, to the advantage, it was alleged, of the soil on which it was distributed.

The sewage of a part of Edinburgh, as every one must know, has been used for irrigation for 200 years on the same land. There are comparatively few water-closets to increase its value. The larger area under irrigation has only been about thirty-five years under treatment. Near the shore it is mere sand, originally worth 5s. an acre, but now assessed at 22*l.* an acre. Other parts originally worth 6*l.* 10s. an acre now produce 30*l.* The sewage is not so well deodorized at Edinburgh as at Carlisle and Croydon.

On Tuesday the Metropolitan Board held a special meeting as to the tenders for disposing of the sewage of the metropolis. A report was brought up from the Main Drainage committee recommending the Board to give them authority to negotiate with Messrs. Hope & Napier as to the precise terms on which a concession might be granted to these gentlemen for the disposal of the sewage on the north side of the Thames. Mr. Freeman moved that the report be received and the recommendation of the committee adopted. A very full discussion ensued; and, notwithstanding that several amendments were moved, the original motion was carried by a majority of 26 to 9.

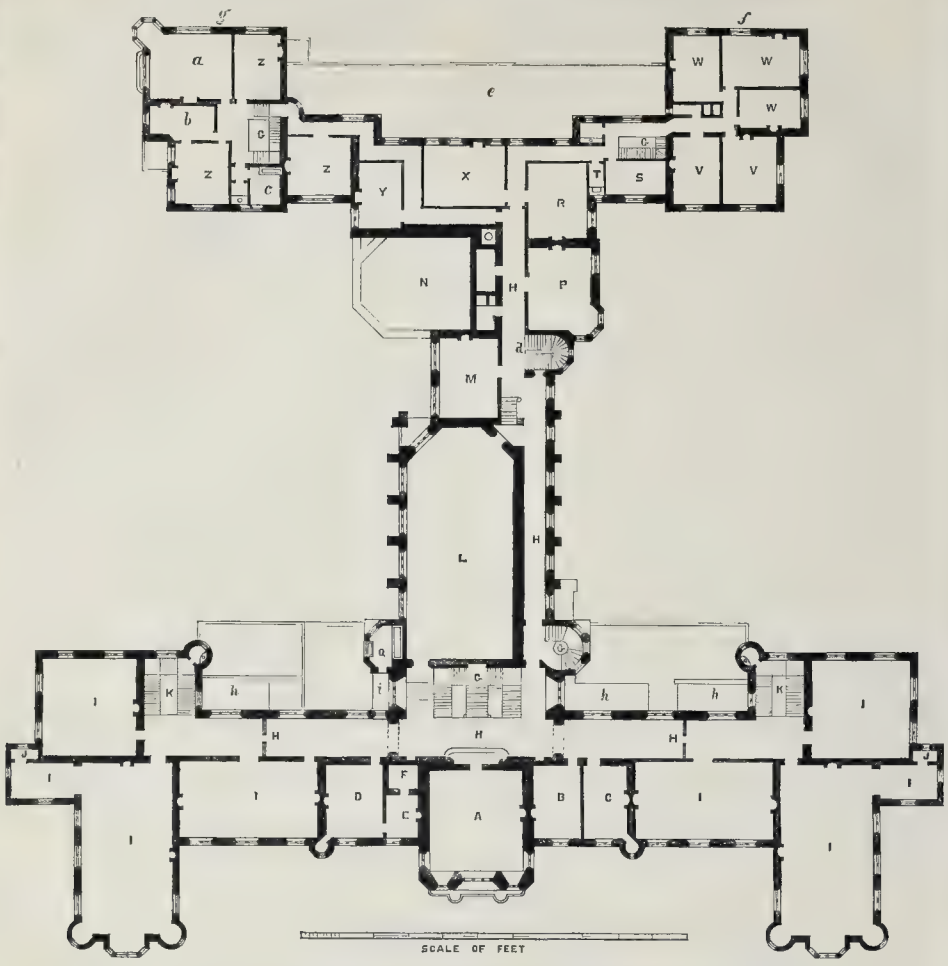
If it be true that an epidemic has already been raging at Woolwich in consequence of malaria caused by the sewage of the northern outfall at Barking Creek, the necessity for prompt measures is made further obvious.

In connexion with the general question of the disposal of sewage, we may add that the utilization of sewage is at present creating a stir in Birmingham; and that the Sheffield corporation have addressed a memorial to Sir George Grey on the same subject, in which they pray that Sir George will introduce a Bill in the next Session of Parliament to carry out the recommendation of the Parliamentary committee, and effectually prohibit sewage and any foul and offensive matter from being discharged into streams and rivers.

The question of an outfall sewer is at present under consideration at Sheffield. The surveyor has been required to prepare plans for one to Blackburn Forge; but an endeavour has been made to induce the council to rescind this order till the surveyor prepare a report upon the whole scheme of carrying the sewage from the town, and utilising it; giving at same time an estimate of the cost. The surveyor meantime has expressed his intention not to report upon the matter or make his plans until he has visited most of the chief sewage works in the country, and seen some of the most eminent engineers who could advise him as to the best plans to adopt.

ST. MARY'S, ABERDARE.

This new church has been consecrated. The building is in the French Gothic style, rather freely treated. The edifice is constructed with the Newbridge stone, with Bath stone dressings. It is divided into nave, side aisles, chancel, side chapels, and a vestry under the tower. The nave arcade is carried on complete. Iron columns separate the aisles from the naves. The shafts on the responses and in the chancel are of green Bridgend stone with carved Bath stone capitals. No clerestory is employed; and the roof, which is of an open wooden construction, springs nearly from the centre of the arches. Some of the side windows are placed in the gables. Most of the glass employed is of a greenish hue. Both nave and aisles are filled with open benches painted in imitation of oak, and calculated to hold about 700 people. The carving, which is profuse, is in the style peculiar to the era. The exterior has a marked appearance, partly derived from the peculiar colour of the Newbridge stone and the profuse Bath stone dressing, as well as from the number of gables (six), thrown up on the south and north sides, breaking up the roofs and relieving it from the monotonous appearance of the slated roof. The tower springs from the south side of the building, and is 90 ft. high, surmounted by a deep roof, topped with ornamental iron work. The length of the building is 100 ft., with a breadth of 52 ft., and enclosed in a courtyard, surrounded by four low walls, with ornamental iron railing at the top. The interior of the yard is planted with trees and shrubs. The whole of the carved work, both wood and stone, has been done by Mr. G. Whittington, of Newport, Salop. The architect was Mr. Arthur Blomfield, of London, son of the late Bishop Blomfield. The builder was Mr. P. Rees, of Aberdare. The contract was taken at 2,090*l.*, but the total cost will be about 3,800*l.*



TELEGRAPHIC PROGRESS.

The process of manufacturing the cable for the Atlantic telegraph is rapidly proceeding, and it is calculated that if the submergence of the line be satisfactorily accomplished, the communication between Great Britain and the American continent will be completed by the close of July next. There are seven copper wires to form the conductor. The entire length of the telegraph will be 2,300 miles, so that there are 16,000 miles of copper wire. Every portion of this copper wire is subjected to electrical tests to ascertain its quality for conduction before it is allowed to be worked up. The next stage is to coat these wires with eight successive coats of the insulating material, equal to an aggregate length of 18,400 miles. This core is next covered with jute, wound round it from ten strands, making 23,000 miles of jute yarn. Then comes the outer coating formed of the ten covered iron wires. The iron wire itself is 23,000 miles in length, and each wire is covered separately with five strands of tarred hemp, 135,000 miles of the latter being required, making together an aggregate length of material employed of 215,500 miles, or very nearly as much as would put ten girdles round the earth, or form a line that would stretch almost from the earth to the moon.

FETTES COLLEGE, EDINBURGH.

The first stone of this building, of which we give a view and the plan of one story, was laid at the end of June last. It is being erected from the designs of Mr. David Bryce, architect, and will cost about 70,000*l.* The contractors for the building were,—Mr. Alexander Morrison, mason's work; Messrs. Beattie & Sons, carpenter's work; Mr. M. Carstairs, plumber's work; Mr. Jas. Allan, jun., plasterer's work; Mr. Thos. Crombie, slater's work; Messrs. Todd & Sons, iron-work; and Mr. Parnell, warming and ventilating.

a

FETTES COLLEGE, EDINBURGH.—*Plan of Class-Room Floor.*

The south and main front is 270 ft. in length, and includes a central tower, 190 ft. in height, with corbelled turrets at the angles. In the ground-floor of the tower the principal entrance to the college is placed, and over it is a projecting balcony. Three of the four stories in the tower which rise above the balcony are recessed in the centre, and surmounted by an elliptical arch. Above the arch, the tower resumes its square form for some distance, when it ends in a corbelled balcony, from which the spire takes its rise. On the ground-floor the space on either side of the tower within the projecting wings forms a piazza with an arched front. The wings have corbelled round towers at the front angles above the ground-floor, which are carried up and finished with conical roofs and iron finials. From between these round towers a crow-stepped gable springs, and in the centre of the front of each wing there is a large oriel window, surmounted by a carved parapet. The front portion of the building terminates at either end in a square tower. These towers are finished with spiral ...fts at the angles, and terminate in lofty roofs, ...h spring from enriched cornices. Two slight towers, rising from a buttress at the ... the first-floor, flank, at a short dis... central tower, and relieve the expanse of wall between it and the side wings. These towers are each surmounted by sculptured figures. The main roof contains two tiers of dormer windows, and is finished with an iron brattishing. The ground-floor of the front part of the college is chiefly occupied by the piazza, gymnasium, work-rooms, and accommodation for the warders. At the north-west end of the anterior limb of the college is situate the dwelling-house of the rector. The two portions of the college are connected with each other by the chapel, seen in our view, and a range of offices. The chapel has the dining-hall incorporated with it, the latter occupying the ground-floor. The chapel rises above the buildings attached to it on the north side, and that end of it has been reduced to an octagonal shape. Projecting buttresses, terminating in pinnacles, divide the building into five bays, and at the north-west and north-east angles, double-flying buttresses have been introduced. The arched windows of the chapel are filled with tracery, and each is surmounted by an open traceried gable, crocketed. Internally, both the chapel and dining-hall measure 56 ft. by 30 ft., and the former has an open timber roof. The external walls will be composed of stone, either from Craigleith or from a quarry in Fife.

FETTES COLLEGE, EDINBURGH. NORTH-WEST VIEW.—Mr. David Bryce, R.S.A., Architect.

THE ANTIQUARIAN DISCOVERIES AT BRADWELL.

We lately published a short account of the visit of the members of the Essex Archæological Society to the ruins of the ancient city of Othonia, discovered a few weeks ago by a land-reclaiming company, on a point of land in Essex formed by the confluence of the river Blackwater and the German Ocean. We now give some additional particulars, which will be read with interest. The excavations on the south side of the ploughed field, which consists of raised land, have revealed a piece of wall 23 ft. long and 5 ft. 6 in. high. It is 15 ft. in thickness, built of layers of almost squared stones of three courses each, alternated with courses of tiles of three or four rows, and is unquestionably Roman work, and must have been built before the Romans left this country, during the reign of the Emperor Valentinian, about the year 400. Near this wall were found three skeletons. The skulls were close to it; and in each case a Roman coin was found close to the ribs, as if at burial it had been placed in the hands, or under the tongue of the deceased, which was more in accordance with custom, and in time, by the decay of the body, it had fallen. These coins had evidently been placed, in accordance with the heathen custom, for the purpose of paying Charon for ferrying the soul over the river Styx to the land of rest. No sooner was this portion of the wall discovered than it was immediately conjectured by Mr. J. Oxley Parker, the gentleman to whom the land belongs, that it was but a part of some fortress. Accordingly, men were set to dig in various places in the field, and the result was that the same kind of building, having a uniform run of sets-off, was discovered, extending to a great distance and forming nearly a square embracing about three acres. The wall also still revealed the same thickness, and almost every shovelful of earth brought to light some curious relic of pottery, or a bone, the latter being probably the remains of some soldier picked from the cohorts of Rome. Another curious fact noticed was that in some places where the men dug, the very soil which formed the foundations of this massive work was made up of broken materials and rubbish which could only be accounted for by the supposition that before the Romans built this wall there had existed buildings belonging to probably a pre-Roman period. In some places were found skeletons apparently not Roman; for instance, five were discovered laid in confusion, with their faces downwards: no coins were near them, and it is surmised that they were the remains of Saxons or Danes killed in the attempt to make a conquest of the fortress. On the east side of the wall, and about 60 yards from the first-discovered portion, there have been laid bare walls of a different kind, built of rough stones, but firmly held together with intensely-hard mortar, of a light pink colour. This is probably the remains of a villa, for in the rear there is a huge deposit of oyster-shells deep in the ground, the contents of which have probably gratified the appetites of the inhabitants.

Near this villa have also been found several coins, of the following Roman emperors,—Crispus, Julian, Constantius, Gallienus, Gratian, Constantinus, and Caracius; but many have their discs obliterated. A bracelet, such as was worn by ladies of distinction, was found near the same place. At some distance to the left was also observed a dust-hole, or pit, containing the ashes of the station and bones of goats and swine, and here and there pieces of armour. One or two Saxon coins have also been found. It is somewhat singular that these ancient remains should exist close to the building described in the *Builder* of the 5th inst., the origin of which has puzzled all archæologists. The discovery of the ruins, however, has thrown some light on the subject; and although two or three antiquaries who have visited the interesting spot within the last fortnight do not consider it a Roman building, yet others contend that the presence of Roman tiles liberally used in its construction, and its contiguity to the ruins, establish the fact that it is the most ancient building in existence in the county. Some antiquaries recognise in it all the appearances of a Roman basilica. The centre is raised, and, in all probability, has been originally built in that form, and therefore convenient for all the purposes of a building used as a market, a court of justice, or place of religious worship. The eastern end is now built up in modern style, but in the wall there are the remains of an apse similar to the basilica of St. Paul's, at Rome. This, however, has been considered by those who hesitate to pronounce the building of Roman origin, to have been the apse in use when it was converted into a church, or originally built as such. The roof is modern, owing to the destruction of a great portion of the edifice, at some distant period, by fire. This ancient erection is spoken of by old historians as having a tower (probably a small one on the roof) and two bells, and that a priest officiated in it on Sundays, Wednesdays, and Fridays. But so far back as 1442 it appears to have puzzled the learned, for a "verdict" of a jury upon the building at this period informs us that this church had a chancel, nave, and small tower with two bells; that it was burnt; as to the period, however, when the church was founded, and by whom, this jury knew not. In all probability there will be further light thrown on the subject of these ancient erections and ruins in the course of a few weeks by the progress of the excavations. Possibly within the area inclosed by the walls will be found tesselated pavements, skeletons, coins, and other relics of the Roman occupation. It seems, admitted, however, that this spot is to be identified with the ancient Roman city of Othonia, which was subsequently called Ithanacester by the Saxons, a corruption of *Othona* and *castrum*, the castle or station of Othona; and that the sea, after having advanced on this ancient city, and covered it for a thousand years, is now retiring and bringing to our notice not only the remains of a once populous Roman city, but also an ancient pre-Roman town of the early Britons. It is a remarkable fact that several places in Essex were named by the ancient Britons after the gods they worshipped. For instance, Helmsted owes its origin to the goddess Helmsteed; and in the same way Othona, or Ithuna, is probably a corruption of the word Iduna, a goddess of great repute before the Roman invasion.* For the information of those who may wish to visit the place, we may observe that Bradwell-juxta-Mare is sixteen miles from Maldon, the nearest railway station.

THE ACHITECTURAL ASSOCIATION.

The usual meeting of members was held on Friday evening, the 11th instant, at the House, in Conduit-street.

The chair was taken by the President, Mr. J. H. Christian.

The following gentlemen were elected members of the Association:—Mr. A. G. Colpoys, 37, Bedford-place, Russell-square; Mr. J. C. Scoles, 146, Marylebone-road; Mr. B. A. Paice, 38, Upper Bedford-place; Mr. Edward Marfee, 2, Oriental-place, Peckham; Mr. E. H. Bearne, 120, Albany-street; Mr. Isaac Jones, 50, Gerrard-street, Islington; Mr. M. C. Bramwell, Oxford; Mr. S. W. Tracy, Bedford Chambers, Southampton-street, Strand; Mr. J. E. Walker, 26, Chelsea-villas, Brompton; Mr. J. H. Hargrave Stevens, 468, Hackney-road; Mr. G. J. Lough, Tachbrook-street, Pimlico; Mr. F. Payne, 56, King-street, Whitehall; Mr. E. H. Horne, 71, Adelaide-road, Haverstock-hill; Mr. W. R. Tilling, 37, Alpha-road, Regent's Park; Mr. A. Pite, 38, Bloomsbury-square; Mr. W. T. Law, Wood-street, Northampton; Mr. W. Warne, 10, Cloak-lane, City; Mr. R. Groves, 23, Alwyn-street, Islington.

Mr. E. G. Tarver brought under notice the subject of the proposed class for figure-drawing, which, he observed, it would be desirable to organize as soon as possible. The sub-committee which had been appointed to take the necessary steps with regard to securing necessary accommodation for the class had inspected the West London School of Art, in Bolsover-street, where two rooms were offered them. One was a small apartment which might hold twelve or fourteen persons; and the other a large room (containing the casts of the school), which would accommodate fifty or sixty persons. The committee were informed that the large room might be had for two evenings in the week at 3*l.* a month, and the smaller room at 2*l.*; but they had subsequently been informed that the larger apartment only was now available. A competent instructor had been found in the person of Mr. Poynter, who would give his services to the class at a remuneration of 2*l.* per month. The cost of models and other incidental expenses would be about 2*l.* per month more, making a total expenditure of 7*l.* The sub-committee suggested that arrangements should at once be made for the assembling of the class, and that possibly Tuesday and Thursday evenings might be the most convenient for the members joining to attend.

The Chairman observed that if the use of the casts was to be included in the rent of 3*l.* per month, he thought it moderate; and recommended that the offer of the West London School of Art be accepted. He was also glad to hear that the services of so efficient an instructor as Mr. Poynter could be secured.

Mr. Tarver said that the class would have the privilege of using the casts, and that the rent would include lighting and heating the room.

After a short discussion, it was resolved to carry out the arrangement as suggested by the sub-committee, in order that the class might meet with as little delay as possible.

Mr. J. P. Seddon, who had promised to read a paper on "Tone in Architecture," having apologised for the accidental loss of his paper, then proceeded to make some observations on the subject, which he illustrated from time to time with diagrams and the drawing-board. He observed that, in his opinion, English Gothic was the best, and that there were no moderate-sized buildings on the Continent which could compare with such specimens of church building as Great Walton Church, in Norfolk, and that of Stone, in the neighbourhood of the metropolis. Much of the tone of architecture depended upon the materials employed; and, for his own part, he preferred as near an approach as possible to the old Roman brick, 10 in. long by 2½ in. high. With regard to stonework, ragstone was, in his opinion, very awkward to work, and anything but seemly when used. The great thing was to get work long and thin, putting every stone on its best bed, and getting a good quoin formed with a double stone. To insure this, he would have the stone dressed. Irregular rangework, well carried out, had a good deal of tone in it, and made the face-wall look much better than could be accomplished by the introduction of unnecessary and costly architectural details. The quality and colour of the slates to be used were also important considerations. He had himself used some excellent slates from the neighbourhood of Haverfordwest. Stone tiles were, of course, more expensive, but those invented by Mr. Taylor were very satisfactory of their kind. He also recommended young architects to be particular in obtaining really good stained glass and good ironwork, as dissimilar as possible to the quaint spiky stuff which some persons seemed anxious to introduce. Care ought also to be given to encaustic tiles for pavement, and these could be had of Mr. Godwin, or Messrs. Maw & Co., who produced as good an article as any made in ancient times. In conclusion, he recommended students of architecture to avoid vulgar showiness, incongruity, and exaggeration, all of which were inconsistent with a good tone in architecture.

Mr. Webber commented upon the difficulty of getting good thin stone in the metropolis, and inquired of Mr. Seddon what stone of the sort was accessible for London work.

Mr. Seddon replied, that very good stone could be obtained in Monmouthshire and Glamorganshire, and that quarries were to be found at Newbridge, from which it might be conveyed by way of Cardiff to London. He recommended architects not to be always led by information obtained in the immediate locality of the place in which their work was to be carried out, but to examine the old farmhouses and buildings in the neighbourhood, by which means they might probably obtain a better stone.

Mr. Spiers agreed with what had been said with reference to adopting the Roman form of brick as much as possible, and spoke of the enduring properties of those found at Rome and at Herculaneum.

Mr. Webber called attention to a stone from Dorsetshire, now being used for dressings in some new houses in Cheapside. If the stone in question would be found to bear the London atmosphere, its introduction would be desirable; but this time alone could prove. It was not, however, much liked by workmen, because it was prepared at the quarry. On this account, perhaps, it was that they discouraged its use, and described it as a soft sandstone, which he fancied it was not.

A member called attention to the use of an artificial slate made, as he understood, in the neighbourhood of Harwich, which experience had shown to be open to three objections. The first was that it was very heavy; the second that it absorbed a great quantity of moisture, and consequently tended to make the building

* In confirmation of this, the discovery of a Tascian Roman pre-historic small silver coin, in the possession of Mr. J. O. Parker, is a plain proof of the pre-Roman occupation.

especially if open-roofed), very cold; and, hirdly, that when exposed to a low temperature, became extremely friable.

Mr. Eddis said he had found a very useful tone in Mid-Sussex, near Horsham, which, when irst taken from the quarry, was of a dark colour, ut which, after being exposed to the atmosphere, assumed a grey tone very agreeable to he eye.

Mr. Webber observed that, in his experience, he ad tested the desirability of making extended nquiry for stone before selecting that which night be recommended by interested persons on he spot. In one case, he found an excellent tone in an old mansion-house in the neighbourood, and on inquiry he obtained a supply of the ame description on the estate on which the uilding was to be erected, and the cost of which as merely nominal as compared with that hich had been recommended to him.

Mr. Tarver expressed a hope that greater ttention would be paid to iron work. Some ecent examples which he had seen reminded im of fireworks more than anything else, while thers resembled ruled music! He recommended nat such abominations should be carefully schewed.

The Chairman saw no reason why the flat or Roman brick should not be more generally used. He was glad to say that there was no longer much difficulty in getting a supply of them.

After some further discussion, a vote of thanks as passed to Mr. Seddon for his address.

The next subject for the Class of Design is, A Side Elevation," and the meeting on the 5th instant will apply itself to discussing eports and the Architectural Alliance.

BRAIN-WORK.

Within a recent period death has been busy ith persons engaged in literature and art. Men f mark have been called away, when, by years f experience of human life, by long observation f nature in its various phases, and by the acquiition of the mechanical skill which is needed in he production of books or of pictures, they had tted themselves for greater things, so that e might, if it had been allowed for them to ave lived to the allotted time of man's age, ave looked for much that would have been onourable to the labourers and advantageous to he community. The pursuit of literature or of rt, especially when employed in periodical pubcations, involves an incessant wear of the brain. here is a never-ending care for the provision of ch week's materials, and the mind is seldom rest. The mill is incessantly at work: the bow always bent; and, before the due time comes, he mill stops; the bow is broken.

We are often forced into such reflections when e glance around and miss so many contempoaries and associates as we do. Let our readers ok round their own particular circles, and it ill be found how large is the number of those ho, having hardly worked their brains, have for er left their places. The last lost, Mr. John eech, died of a heart disease, which no doubt ad long affected the artist's health, rendering im nervous and irritable; so that he has often mused and delighted others when he has been ill ease himself. The failure of Mr. Leech's health ust have partly prepared his friends for the d event that has taken place; but the end as very sudden, for it appears that he wandered out with a friend on the day before his ath, which was so little expected that a children's party had been assembled at the house the day when the master died.

Of others who were connected with *Punch* its early days, many have been removed to eir last rest; amongst them, Gilbert à Beckett, ouglas Jerrold, Thackeray, Landells, and more. The peculiarities of the style of art which eech has helped to render popular amongst demand a note. We see an evident intenon to produce on a wood-block an illustraon similar to a free pencil drawing, or slight ching, quite different from the heavily and aborately-tinted drawings of the Bewick school. this direction, however, Mr. Kenny Meadows d, to a certain extent, set an example; but to r. John Gilbert and Mr. Leech we are mainly debted for the introduction of this novel and eful style of wood-engraving. A chief merit Mr. Leech's drawings on wood is the remarkle effect which is produced with little apparent ort: a few lines in the background, by the illful way in which they are touched in, indicate a most graphic manner the peculiarities of the scenery, both sea and land: large spaces of white are usually left, but these are so managed that a snowy effect is not given when it is unnecessary. To produce this apparent slightness is of itself a great art, which can only be effected successfully by the greatest care on the part of the draughtsman, the engraver, and the printer.

If we compare the works of Mr. Leech with those of Rowlandson and some others of the small band who have attempted to sketch the passing peculiarities of their time, we cannot fail to notice the neat and careful drawing and the refined feeling pre-eminently shown in the former. The prints by Rowlandson are exaggerated caricatures, and so coarse and unnatural that they would not be tolerated at the present day; but in Leech's drawings we have a combination of artistic excellence, truthful attention to nature, and a display of humour which has seldom been excelled. Moreover, his genius ran in no immoral rut; and, dying, "he has left no block that he would wish to *cut*."

THE STONE-CUTTERS' STRIKE, DUBLIN.

The stone-cutters having applied to the Institute of the Architects of Ireland for advice in this matter, the council, through the hon. sec., Mr. Jas. H. Owen, has addressed a reply to them, suggesting that it is beneath such a body of men to squabble about such a trifle as the setting. In conclusion, Mr. Owen says,—"I hope soon to have the gratification of hearing from you that the stone-cutters have returned to their employment, satisfying themselves with the understanding that neither shall they be excluded from *setting* stone because they are stone *cutters*, nor the masons because they are only stone *masons*; but that competency and the employer's sense of his own interest shall be the only as they are the true tests, and such as are likely from their nature to be permanent."

THE CALIFORNIAN EXHIBITION AT SAN FRANCISCO.

A "Mechanics' Fair," or Great Exhibition, has been held in the capital of California, of which we glean some few particulars from a periodical printed and published in the Exhibition building.

As to the building itself, we are told, with excusable magniloquence, considering that it emanates from a city not fifteen years of age, that,—

"The visitor is completely lost in bewilderment at the vastness of the area, the almost endless variety of the exhibition, and the interminable extent of avenues which have been most judiciously laid out in graceful meanderings among the profusion of tables, stands, pyramids, showcases, columns, and cosy little recesses which appear and disappear by turns, as the admiring visitor threads his way along the mile and a half of distance which he must traverse to make the full round of this glorious palace of Californian industry."

"The very building that contains all these trophies of the victory of mind over matter, to be seen at the present Fair, is a work of mechanical art that will add lustre to the history of the San Francisco Mechanics' Institute Fair of 1864. Its dome—the largest ever constructed in the world of boards and scantling, in beauty of proportion and science of its construction is not excelled by that of the famous St. Peter's at Rome. This beautifully proportioned structure is a worthy casket to contain the many gems of human thought, wrought into forms of power, utility, and beauty more glorious than the diamonds, rubies, emeralds, and pearls of the orient and occident combined."

In speaking of danger from alarms of fire, and the means of rapid egress, our authority, the *Mechanics' Fair Daily Press*, says:—

"It has been suggested by persons fully competent to judge, that though the doors may be few and small, there would be still greater danger if they were larger, and visitors were instructed to make the doors their only places of exit. It is well known that the Pavilion is constructed of a very light description of redwood boards, which any man, with stout boots, may readily kick from their fastenings. There is moreover an abundance of every kind of instrument needed in such an emergency, to readily make openings wherever they may be needed, even through much stronger walls."

Here are one day's receipts:—

"At the door, 1,600 dols.; cheese money, 89 dols.; from skating-pond, 87 dols.; for fruit donated to the Sanitary Fund, 5 dols.: total receipts, 1,781 dols. For Sanitary Commission, 181 dols."

The general nature of the contents of the building may be gathered from the following remarks on the subject:—

"The advance of California in the arts, agriculture, and manufactures, as exhibited by specimens at the present Fair, is most gratifying and important. The manufactures of wool and glass, on exhibition, for variety, quality, and design, are not excelled by similar manufactures in any State in the Union. The value of the articles made directly from the natural productions of our soil—such as resin, turpentine, kerosene, wines, spirits, and others—exhibit the variety of the as yet latent resources at our people's command; while the number, utility, and character of the machines and appliances of machinery for saving labour and other economical purposes, show that the inventive genius of our people is active and triumphant. One important lesson these fairs have taught the people, with incalculable advantage to the country, has been the intimate relationship between art and science."

"Here we find engines constructed with marvellous ingenuity, having for their motive power, steam, hydraulic pressure, running water, caloric and electricity, motors almost unknown in the last century. The very nature of the inventions introduced at this fair speaks volumes in favour of the mental superiority of our local mechanics. Here we find no contrivances to sharpen a pencil, clean a knife, or rock a baby to sleep, such as so many of the Eastern mechanics bother their brains in perfecting; but powerful and effective machines for crushing the hardest rocks to the finest powder, for pumping large volumes of water from vast depths, sawing the largest logs that grow in the world, or to save the impalpable particles of the precious metals."

Towards all who would dare to doubt the superiority of everything San Franciscan or Californian, our enthusiastic authority thus advises his fellow citizens to act:—

"Let us point the new comer to these evidences of our industry, genius, and resources. Where in the wide world at the present, or in all past time, can be found the community, of our age and strength, which can rival, or even reasonably approximate, the display which the mechanics of California are now making in this city? Let us take our new-found and doubting friends by the arm, and walk with them through the aisles and avenues of our magnificent Temple of Industry, and ask then seriously if they can go away and pronounce California anything short of what has been claimed for her by her most sanguine friends. Take them through the Gallery of Arts, and ask them where on the continent, out of the three great metropolitan cities of the East, can they find a better display of artistical talent. Point them to the beautiful floral pyramid which adorns the interior arch of the great dome, and tell them that a display equal to that can be made in this city every month in the twelve! Go with them through our public libraries, and spacious, well-ventilated reading-rooms. Point them to our schools, public and private, and our well-filled collegiate institutions. Have we no literary taste? Take them through our principal streets, point out to them our magnificent churches and other public edifices, and our splendid private residences, furnished with every luxury and comfort known to modern seekers after *otium cum dignitate*. Ask them to consider that they are walking the streets of a city but fourteen years old, and yet the fourth commercial city in the Union, out of whose 'Golden Gate' pours a monthly stream of treasure which, in a decade, has nearly doubled the monetary wealth of the world."

The floral productiveness of the climate all the year round would appear to be rivalled by its frugiferous abundance, if a single bunch of pears in the Exhibition, fifty in number and 19 lb. weight, on a single stem 8 in. long, be any criterion. Our authority may well call this *extra*ordinary; but it seems to augur well for the ordinary fruit crops also.

Taken as a whole, Californians may, it would appear, well be proud of this "grand exhibition of their skill, industry, and taste." It is emphatically, "what it was designed to be—an exhibition of Californian industry." Those who have witnessed the previous exhibitions in this city, according to our authority, "cannot fail to notice the marked superiority of this over either of its predecessors, in the way of a prominence of home over foreign industry."

PUBLIC WORKS IN THE COTTON DISTRICTS.

The last report made by Mr. Robert Rawlinson to the president of the Poor Law Board, shows—"the amounts granted under the Public Works Acts, 1863-64, to each public body, the sum actually paid in each case, and the number of factory and other workmen employed on such works in each district." From this we learn that the total amount at present appropriated is 1,796,646*l.*, of which, instalments amounting to 742,260*l.* have been advanced. The total residue of these loans to be advanced as works progress is, therefore, 1,054,382*l.* But as the whole amount set apart for the purposes of these Acts was 1,500,000*l.* + 350,000*l.* = 1,850,000*l.*, there is yet a sum of 53,354*l.* to be appropriated. Applications exceeding the amount of this balance are, however, now under consideration of the Board.

As to the number of men who were employed upon works during the last week in October, it is seen that there are 4,002 returned as factory operatives, and 2,422 as skilled labourers, making a total of 6,424. But it seems that in Blackburn and in other places, numbers of men, who were formerly factory operatives, and have now, through a long experience upon these public works, become skilled labourers, are unwilling to declare themselves "factory operatives," lest the confession should be taken to invalidate their skill as labourers.

The great demand for stone, bricks, and other

materials, which the execution of improvement works has created, has also been an additional means of providing employment for a large number of persons who are not included in this statement. Mr. Rawlinson estimates them at not less than 2,000, which will make a total of 8,424, who, with their dependent families, will represent a population of from 30,000 to 40,000 persons deriving their subsistence from these works.

Subject to the condition imposed by the Acts, that the works are of public utility and sanitary improvement, the devising, direction, and execution of the works are entirely in the hands of the local authorities and their officers. The Reporter says,—

"Of course the proportion paid in materials, skilled and unskilled labour, must depend upon the character of the works in each instance; but, considering the sanitary advantages of the works undertaken, and the need which existed for their execution, it can hardly be deemed a matter for regret that the local authorities have, in their selection of works, thought as much of sanitary improvement as of the amount of employment which would be afforded to indigent factory operatives."

We can scarcely doubt that great advantages will result from the works that are being executed, quite irrespective of the means of support thus afforded to distressed factory operatives.

MONUMENTAL.

THERE has been erected in the cloisters of the chapel of the Charterhouse a monument to General Havelock, K.C.B., who was educated at that school. The design combines eight different marbles, and the inscription, in letters of gold on the black plinth, runs thus:—"The schoolfellows of Major-General Sir Henry Havelock, K.C.B., erected this monument in memory of him and of other Carthusians who have fallen in war." The face of the monument is divided into fifteen compartments, gilt, on which are to be painted the names of all who have distinguished themselves and fallen in the service of their country.——The Combermere equestrian statue, subscribed for by the gentry of Cheshire and others, is nearly completed by Baron Marochetti. The figure is 8 ft. high, mounted on a charger, and further elevated by a granite pedestal. It will stand in an open space opposite Chester Castle. The cost will be 4,100*l.*——Merthyr is to have a Town-hall, and chief amongst its decorations is to be a bust of the first member of the borough, Sir John Guest. The sculptor is Mr. Joseph Edwards, a native of Merthyr.——The Albert memorial statue for Dublin has been entrusted by the committee to Mr. Foley. ——A monument to the late Lord Massereene and Ferrard is at present in the studio of Mr. J. R. Kirk, Dublin. It is about to be erected in the parish church of Antrim. The size is 14 ft. in height and 8 ft. in width, and the character of the whole structure Lombardo-Venetian. The principal feature is the full-length figure, representing the deceased, which lies in a recumbent position, draped in the robes of a Knight of St. Patrick, with the collar and badge of the Order. The statue is surmounted by carved canopies, on which are numerous finials, small statues, &c. The figure is life-size.

THE WEST-END PARKS.

WE can only judge of things by comparison; and in this way the parks at the west end of the metropolis even now do not show favourably, when we think of the noble examples of landscape gardening which are to be met with in many parts of England. We need, indeed, only go to the grounds of the Crystal Palace, to see how, under energetic, skilful, and tasteful management, a space can be made to assume an aspect of fairy-like beauty. Nearer at hand, at the Victoria Park, we may see how great a change can be wrought in a few years by proper care and judgment. In this park, the display of flowers in their various seasons is delightful to the eye; and in all directions the once flat and unpicturesque site gives indications of what may be expected in forthcoming years. The young trees, skilfully grouped, both foil and harmonize in form and colour, and are each year increasing in size and strength; and there is every indication that we shall have here in due course of time stately trees, forming little groves amid the shrubs and flowers; and all this is done at no great cost.

In some of the suburban cemeteries, in the most unfavourable soil, the success of the gardener is extraordinary. Look, for instance, at Ilford; but in St. James's Park, Hyde Park, Kensington Gardens, and the Regent's Park, a timid policy seems to prevail. Nature has furnished fine trees and other natural advantages; but each storm that blows destroys the decayed branches of the trees. Even the great trees are sometimes taken up by the roots; and those who remember Kensington Gardens, St. James's and the Hyde Parks, a quarter of a century ago, believe that the old trees, before many years have gone by, will have lost the power of throwing forth their greenery, and then those grounds will be dependent on other means for their beauty; and it seems doubtful if the trees which have in parts been planted in with mathematical precision will ever arrive at perfection, or even if they do, will then present an appearance which will be in any way commanding as points of the landscape. It seems to us that the trees that have been planted in recent years show want of attention to grouping, with a view towards general effect. As regards Hyde Park, a large portion must be kept plain for military displays and other public purposes; but there is no reason why the margin of the surrounding carriageway should not be decked with flowers in a far more effective way than they are at present. Mr. Cowper has done a good deal, but might do more, if he were braver.

In connexion with our metropolitan parks there is a want of distinctive features. Is it impossible, by means of a reasonable expenditure, to procure extensive and shady avenues similar to those at Bushy, Hadfield, and elsewhere? Still, in the Regent's Park, the trees at each side of the long walks seem to give promise for the years to come. Similar beginnings should be made elsewhere, and no time should be lost, for those things are slow in attaining perfection. Our metropolitan parks greatly require a combination of architecture and sculpture with the other features. Terraces might be planned at various points with good effect, and in association with them fountains and flower-beds, where the various trees might be shown in large but shapely masses. It used to be said that the public were not to be trusted with such things; that opinion, however, is, now one of the exploded ideas of the past, and too much pains cannot be taken to render the parks elegant places of resort and recreation. What is wanted is a good plan for the future, laid down by a competent authority; and this should be adhered to, and steadily carried out.

COMPETITIONS.

The Sir Tatton Sykes Memorial Competition.—Competitors are complaining that they have heard nothing yet of the decision of the committee.

Chapel and Schools, at Pembroke Dock.—Sir: In consequence of an advertisement which appeared in the *Builder*, on the 22nd of October, I took some trouble to obtain the particulars of a new chapel and schools, to be built at Pembroke Dock. I find that the committee do not intend to employ any architect, and only offer the premium of 25*l.* for drawings, specifications, details, and perspective view, *provided* the design is approved of; which, considering that for the sum of 2,000*l.* a large chapel is to be built, in the Byzantine or Gothic style, to seat 1,200 persons, and also a school-room under, 90 ft. by 60 ft., and 13 ft. high, does not seem very likely, particularly as walling stone is to be brought in its rough state on the ground for 5*s.* per ton.

ONE WHO WOULD HAVE COMPETED.

CISTERNS AND PIPES FOR PURE WATER.

A PRACTICAL plumber, J. Cutler, comments on the known evil resulting in many cases from the retention of water in lead cisterns, and allowing it to run through lead pipes, and urges as a remedy the provision of glass cisterns and glass pipes for the purpose. As a simple mode of arranging this, he says,—"Make a good strong wood cistern, and line it with common sheet-glass, as common as it can be made; say 26 oz. or 32 oz. to the foot; putting bars or fillets of glass, half an inch square, on the corners, and up the angles with shellac, the same as is now used in putting glass letters on windows, or fillets of mastic. I have no doubt but our scientific and chemical men could soon find something that would properly secure the joints in this way. I would suggest that green baize, or some soft material might be put between the glass and cistern. This being done, care should be taken with the pipe supplying the cistern from the main, that when the water is turned off, the pipe should empty itself, to prevent its freezing and stopping the water coming in next day."

CISTERNS AND DRAINS.

WITH reference to a letter (p. 176, *ante*) as to the present system of taking the overflow or waste pipe into the trap or drain, I think this system is highly injurious to health. I have often noticed a thick scum on the surface of the water, produced by the foul air from the waste-pipe; but I think bending the waste-pipe into a syphon would be rather difficult in most cases, because the generality are what is termed trumpet waste-pipes,—that is, 3 in. or 4 in. in diameter at the top, and reduced to 1 in. at the bottom; and if it were not bent exactly, or placed in its proper position, it would leak: consequently, in a few hours, the cistern would be empty. [Moreover, the syphon itself would empty the cistern.] Now, I think that the most simple remedy would be to solder an ordinary bell-trap, according to size, into the top of the trumpet waste-pipe. The additional weight would keep it firm, be easy to remove, and answer the purpose in every respect by regulating the ball-tap so as to keep it always charged.

W. B.

ON THE REPORTS OF THE PROCEEDINGS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

SIR,—Permit me, through you, to congratulate the Royal Institute of British Architects on the report of the president's opening address appearing in your columns. I might congratulate the whole profession also, as well as the reading public, that such highly-important advice, and such valuable materials for thought and reflection, have not been consigned to oblivion,—*preserved*, like memorials of past time, in the pages only of the Institute's printed "Proceedings."

I hope this report will prove to be the harbinger of a better, a wiser, a more liberal and useful course than that which the Institute has lately adopted, of hiding its light under a bushel so to speak, and not permitting its precious papers and communications to appear abroad.

How the new system may have affected the sale of the printed "Proceedings," published by the Institute, I do not know; but I should expect that it cannot permanently have increased the profits, while it certainly has diminished the usefulness of the Institute to the whole profession, and dimmed its lustre in the eyes of a discerning public. It is desirable for all societies, whether for the advancement of science or the promotion of art, that an early notice of their proceedings should be given to the public. This will be found most profitable in the end, as it assuredly is most proper at the time. Besides other advantages, it diffuses a knowledge of those proceedings among persons who would otherwise never hear of them, and may increase the demand for the official publication, with illustrations, among others than those who are immediately interested in them. There is always a multitude of *outsiders* who can thus gather up the crumbs that fall from the well-furnished table in Conduit-street, and transform them into vital nouriture to their own and their employers' advantage. The professional and public loss sustained by the reports having no longer been permitted to appear, will be brought home to the convictions of all, by reflecting on the loss which would have been incurred had not the present accomplished president's admirable address have gone forth as it has done. *Outsiders* would have known nothing about it; the reading public would never have heard of it; the sound advice and the precious fruits of a life of professional exertion and of philosophical inquiry into the principles and influences of art would have been almost utterly lost; they would have found their way into the printed "Proceedings," fossilized in its pages for some future generations; but their living impressions would have been effaced.

H. C. BARLOW.

SIR,—Every one who takes any real interest in the advancement of art must be thankful to you for the remonstrances which you from time to time address to the Institute, on the question of the publication and proper reporting of their transactions. It is sad to see such narrow-minded counsels still prevail with the governing body. In any society, wise men are often in a minority. It is hard to believe that all those whose opinion is really worth having concur in the present exclusive method of proceeding.

What on earth is the object of the Institute, if it be not to promote to the utmost the improvement of architecture? Surely this object, which is professed loud enough in every set speech which is made at the Conduit street meetings, and in every paper read anywhere on the subject, ought to be more the care and anxiety of

bers than the mere selfish desire to protect the Insti-
s copyright.
e Royal Institute of British Architects is not a "pro-
on society," but a society for the advancement of
itecture and its kindred arts.
is not a "mutual improvement" or "benefit society,"
a public institution; and the public has a right to
w what it is about.
very society which *really* wishes to do good in any
courts publicity as the principal and almost only
ns of effecting the object it professes.
e Institute was not founded only for the good of its
bers, but for the good of the public. I would ask—
he public or are members benefited by the present
lations?
ow are outsiders to know the advantages of the Insti-
if they have no opportunity of ascertaining what
on at its meetings?
a disquisition upon law or social science less valuable
after, in a separate form, because it has been first
lished in a newspaper?
rely it is by means of the publicity thus given to it,
the comments made upon it in columns which are in
y one's hands, that attention is drawn to the worth of
ssay and the talents of its author.
f course, this is quite setting aside the question,
ther some of the Institute papers are worth publish-
at all. Some are undoubtedly very good; but some
as certainly far behind what should emanate from
e who essay to instruct the profession.
ublicity would in time raise the tone of the papers,
beget more care in their preparation.
t all events, if people are able to ascertain from the
lic press that the papers and discussions are really
d, the Institute need not fear but that there will be
ty of opportunity of selling the official copies of the
nsactions.
enclose my card, and am, AN ASSOCIATE.

THINGS TO BE DONE.

SIR,—I am in despair. When are the Houses
Parliament to be finished? When is the
son Column to be finished? When is the
t contract for the Thames Embankment to be
npleted? When is the third contract (Temple
Blackfriars) of the Thames Embankment to
completed? When is the Southern Embank-
at (Westminster to Vauxhall) to be com-
ted? When is New Earl-street to be com-
ted? When is the Charing-cross Hotel to be
npleted? When are the new London rail-
ys to be completed? When is Victoria-street
be completed? When is the pulling down of
l Blackfriars Bridge to be completed? When
the New Law Courts to be completed? And,
, when are the two houses at the foot of Big
n Tower—one called Fendall's Hotel—which
ve been pulling down the last two months, to
completely pulled down? Surely some new
ido Fawkes must have hired them to repeat
tory! You say in your paper that a body of
000 workmen were concentrated on the "last
" of the Northern of Spain Railway; and you
r that on the first contract of the Thames
bankment (Westminster to Waterloo), the
al of which is 520,000*l.*, 31,000*l.* was all the
ork done" up to the last weekly meeting of
e Metropolitan Board. The Act for the said
ames Embankment now lying before me was
ssed in July, 1862. Wake up these rapid
rkers,—pray, Sir, wake them up!

ONE WHO LIKES TO REAP AS WELL AS SOW.

*** Our correspondent is a little unreason-
le in one or two of his queries, but in other
spects we echo his inquiry, and ask, "When?"

STAINED GLASS WINDOWS FOR WHITEHALL.

Sir,—Having lately read much about the windows of
sgow Cathedral being filled with stained glass, and
how much they were admired on a recent occasion
the Right Hon. W. Cowper, Her Majesty's First
mmissioner of Works, it occurred to me to ask,
uld it not be well, if we had a little more of this
d of decoration in our London churches, especially in
r Majesty's Chapel Royal? It would be well, there-
e, to draw that gentleman's attention (through your
umns) to the great want of a stained glass window
r the altar of the Chapel Royal, at Whitehall: as the
ar window is the only one that directly meets the eye
entering the chapel, it would be a vast improvement
r the present plain one, and it would also accord better
h the gorgeous gilded ceiling, and valuable paintings
Sir Peter Paul Rubens, which command so much
ention and admiration from foreigners as well as from
glish people. It is to be hoped, therefore, that this
autiful chapel will not be long without its stained glass
ar window. In fact, such a building as that should not
re *any plain* windows at all, but they should all be en-
hed to a certain degree, and the woodwork screens
uld be removed from the windows in the lower part of
chapel (as in former times), as they exclude valuable
ht, and give the chapel a gloomy and melancholy ap-
arance. This is easily effected, as the wooden screens
e only temporary. It is a great pity that anything
uld disfigure such a fine building, which was erected
Inigo Jones for the Royal Banqueting Hall; but
e former Chapel Royal, being destroyed in the fire that
sumed the other parts of the Palace of Whitehall,
is building (being the only one saved) was converted
o a Chapel Royal in the year 1717, and has been used
such to the present time. Such a chapel as this de-
ands that it should have windows that would correspond
th the general beauty of the other parts of its decora-
ns. A. B. C.

THE PATENT STONE BRICKS.

WITH reference to the notice headed "Patent Stone Bricks," which you have been good enough to insert in the *Builder*, allow us to say, that the whole of the bricks which were exhibited at the last meeting of the South Wales Institute of Engineers were made of sand and lime, with the exception of three, which, instead of sand, contained blast furnace scoriæ (also called slags or cinders), treated according to Mr. Parry's patent process, and subsequently ground to powder, an operation which can be effected without the least difficulty.

Where sand is used in the manufacture of these bricks—and so far we have employed sand almost exclusively, as being the cheapest material—it is simply screened or sifted.

In many localities the patent stone bricks could, no doubt, be produced at the *cost* price of 12*s.* per 1,000; and at some of the iron works at a considerably cheaper rate, by using the powdered slag and white lime, but they could not be so sold with any profit. The cost of the patent stone bricks depends essentially upon the prices at which sand (or its equivalents) and lime can be obtained, and upon the qualties of these materials. The price at which they are sold at Newport is 24*s.* per 1,000.

BODMER, BROS.

OUR CROOKED CHIMNEYS.

SIR,—I am one of those unfortunate persons who have had to administer the law under the consciousness that they may have been guilty in past days of precisely the same offence; or, if not exactly so, are actually, while punishing one class of offenders, conscious that they are conniving (to say the least) at breaches of other portions of our statute law.

It is quite unnecessary for the public to know anything more than that I live in a large house, with a most commanding exterior, and chimneys arranged for architectural beauty in fluted or carved Bath stone; but I very much fear (though I have no *legal* knowledge of the fact) that they are pronounced by our country sweeps impossible to be properly cleaned without the aid of climbing boys. What am I to do?

AN OLD "J. P." AND "D. L."

*** The insertion of a soot-door here and there in the right position might probably enable the machine to work efficiently.

RATING RAILWAYS.

The Midland Railway Company v. *The Overseers of the Parish of Bedgewarth, Gloucestershire.*—This was a question (Court of Queen's Bench, Westminster), as to the validity of a poor-rate upon a portion of the Great Western Railway within the parish, over which the Midland had by special agreement "running powers," and the point was whether in such a case the company having power to run trains on the line of another company can be deemed to be in beneficial occupation, so as to be rateable for relief of the poor. There is a special agreement between the two companies under which each has power to run trains over the line of the other; each company has exclusive powers, as proprietors, over its own line. The parish authorities had rated the Midland Company in respect of the profits of that portion of the Great Western line which they used, and which was within the parish. The Midland Company appealed, and hence the present appeal. The Court decided in favour of the Midland Railway Company and against the rate, on the ground that they had no occupation of the line which was rateable.

AGREEMENT TO BUILD ON A LEASE.

Cubitt v. *Smith.*—This was a suit, in the Vice-Chancellor's Court, for the specific performance of a contract, whereby plaintiffs demised to defendant a piece of land on the Pimlico-road and St. George's-road, with a house to be erected thereon, for sixty-six years, at a rent of 70*l.* *per annum*; and the defendant agreed that he would, within eighteen months from the date of the agreement, build a house on the land, of the value of 700*l.* at the least, of not less than three stories high above the basement, of a character corresponding with the house already built; or according to an elevation, section, plan, and specification to be previously approved in writing by the plaintiffs; and "according to the Act or Acts of Parliament for the time being in force for the regulation of buildings in and near the metropolis." Plans of the proposed house were prepared by defendant and approved by plaintiffs. It was afterwards ascertained that the Board of Works objected to the completion of the house according to the original elevation, and required the frontage towards the Pimlico-road to be put back 3 ft., so as to be on a level with that of the adjoining houses. The defendant, who had expended 400*l.* on the house, then ceased to build on the land, and the house was now unfinished. Hence the present suit.

The Judge was of opinion that the contract was perfectly clear in its terms, and one which this Court would enforce. It was plain that the house was agreed to be built according to the provisions of the Act of Parliament regulating the building of houses in the metropolis; and that agreement and the plans were equally binding on both plaintiffs and defendant. By some inadvertence on the part of both parties, the site was marked out in the plans in such a way as to contravene the rules of the Board of Works, but there was nothing in the case to show that the plans could not be in that respect modified. The defendant was bound to go on with the house accordingly, and a decree was given for specific performance of the agreement, with costs.

LABOURERS' COTTAGES.—The Carlow Agricultural Society has awarded the Earl of Bessborough the Royal Agricultural Society's first-class medal for the improvements which he has effected in labourers' cottages. Lord Bessborough, it is said, has built an extremely comfortable class of houses for the tenantry on his extensive property, and has "shown the Irish proprietors how the labouring classes may be comfortably housed for thirty shillings a year."

METROPOLITAN BOARD OF WORKS.

LAST week, a discussion took place in reference to

The Improvement of Park Lane.

The Chairman explained that there were two proposals, one for widening Park-lane, which would involve a very great expense, and the other to open Hamilton-place.

Mr. Tite, M.P., said the opening of Hamilton-place could be carried out at a small expense, but it would require the sanction of Parliament. He moved that the Streets Committee be authorised to give the requisite preliminary notice for next session of Parliament. The motion was carried by twenty-two members to eight.

The Thames Embankment.

The report of the Thames Embankment Committee was read, in which it was stated, that having regard to the report of Messrs. Hawkshaw & Harrison, the Committee were of opinion that the immediate backing of the Embankment wall should be of material wholly obtained from the land; and that the remainder of the filling-in should be supplied from the land and from the bed of the river, in such proportions as, in the judgment of the engineer, should be best suited to form a solid embankment. That they considered the filling-in would be best carried out with material wholly obtained from the land, but that, having regard to the expediency of deepening the river where it was contracted by the Board's works, they recommend the taking of a portion of the material from the river, so far as the engineer might see that such can be practically done.

It was resolved, after some discussion, that the recommendation of the committee be adopted, and that the order of the Board of the 23rd of September, 1864, prohibiting the contractors from receiving any soil for filling-in behind the embankment other than that supplied by the Thames Conservancy Board, be rescinded.

"A heavily-taxed Ratepayer," writing on the embankment question, says,—"Mr. Hawkshaw is the engineer to the underground railway, extending from Charing Cross to the north of London, out of which many millions of tons of rubbish will have to be excavated, and of course removed.

Now, I desire to ask Mr. Hawkshaw—1st. Could he possibly obtain in London a more convenient shoot for this rubbish than into the Thames along the line of the embankment? 2. Would not his company save at least 10,000*l.* out of the sum they will otherwise have to pay for removing the rubbish to the outskirts of London. . . . If the Thames Embankment be formed of the land rubbish heretofore used it will not solidify for years, and will consequently be a constant source of expense for repairs; but, if formed of sand and gravel from the river, assuming of course that the material be not laid on the ground until the coffer-dam has been completed and the river excluded, it must of necessity at once form into a solid compact mass. It should also be recollected that it is for this sand and gravel the ratepayers of the metropolis have contracted and are paying. . . . Large sums of money, amounting to many thousands of pounds, will now be paid by parties for permission to shoot rubbish into the river to the injury of the stream, and much of which will afterwards have to be dredged out again by the Thames Conservators. Who, then, are the parties to be paid for this permission? Is it Messrs. Furness & Ritson, the contractors, or the Metropolitan Board of Works on behalf of the ratepayers, or the Thames Conservators?"

COMPENSATION CASES.

Ex parte Piper and the Hammersmith Railway Company.—This case raises a question of importance with reference to compensation by railway companies for premises taken by them, the precise point being as to compensation for vibration caused by the running of railway trains. There was a viaduct constructed by the company, on which their trains would run, close to the premises of the applicant, Mr. Piper, which were, he alleged, "injuriously affected" by it in various ways, and for this (no part of the premises being actually taken) he claimed compensation. When the line was opened, and the trains began to run, there was a sensible vibration caused to the house, and this was a main item in the claim. The jury gave compensation for this item of the claim, and hence the present question. On the part of the company it was contended that the right to compensation was only for injury caused by the "execution of the works;" whereas this was vibration caused by the running of the trains, which was allowed by the Act of Parliament authorising the line. Mr. Justice Crompton observed, that so was the construction of the line, yet compensation was allowed in respect of it. You can claim compensation for vibration caused by the running of trains through a tunnel under a house; and how does it matter in what manner the vibration is caused, by going under the house, or going by the side of it? The Lord Chief Justice: It may lead to a house going to pieces some years earlier than it otherwise would. And there may be such an amount of discomfort caused by vibration as practically to render the house uninhabitable, depriving the inmates of all the refreshment of repose. I tried a case at the last sittings here, which is very much in point. It was an action for setting up a steam-engine for grinding coffee close to the plaintiff's premises, and part of the complaint was the vibration; and, although the injury was disputed, no one doubted that it was a ground of action. Mr. Karslake pressed that the Lands Clauses Act only allowed compensa-

tion for the injury caused by the "execution of the works," and this was an injury caused by their use, not their execution. The Court said the point was important, and must be discussed and determined, and, therefore, the learned counsel might have a rule *nisi*.

Ex parte Sinnock and the Metropolitan Railway Company.—In this case the claimant had an agreement for a lease of the premises for five years, but had no lease, and the company deemed the case to fall within the rule as to tenancies from year to year, and therefore refused to issue their warrant for a jury. Counsel urged that the claimant had an equitable interest for the whole of the term. The Court granted a rule.

Chew v. *The Metropolitan Railway Company.—Lord Mayor's Court.*—The claimant in this case is a livery-stable keeper, who formerly carried on business in Little Moorfields. The premises have now been taken down for the Finsbury Extension of the Metropolitan Railway. Mr. Bovill, for the claimant, said, Mr. Chew had tried in vain to obtain premises of a similar character. One part of his trade was completely destroyed by this removal, and to be thrown out of business at his (claimant's) time of life appeared to the learned counsel to be a very great hardship. Mr. Chew kept no regular set of books, and therefore he was unable to say exactly what his annual profits were. The books that had been kept exhibited an annual profit of only 170*l.* a year. Of course there must be some mistake about that. During the last five months of his trading, books had been completely kept. The profits for these five months were 143*l.* 8*s.* 6*d.*, or at the rate of 344*l.* per annum. As regarded the trade the jury must say how much the claimant was entitled to under that head. The learned counsel then summed up the various items of claim, which he said he thought would amount to somewhere between 3,500*l.* and 4,000*l.*

Mr. E. Fox (of Fox & Bonsfield) valued the claim at 2,249*l.* exclusive of fixtures, loss of trade, and loss on stock.

Other evidence having been adduced as to the value of the premises and the loss that must ensue to the claimant, the counsel on either side held a brief consultation, which resulted in a verdict being given by consent for 2,000*l.* A model of the premises, made by Mr. Jolley, was shown in the court.

Lloyd v. *The Metropolitan Railway Company.*—At the Sheriff's Court, Red Lion-square, this case occupied some hours. The property was a freehold house in Charter House-square, which was built in 1703, in the reign of Queen Anne, when Charter House-square was a "fashionable" locality, and numbered several lords as residents. The house was leased in 1856 at 70*l.*, and was now worth 135*l.* a year. Property had gone up in the City, and was increasing. For the compulsory sale 15 per cent. was demanded. That sum, on the part of the company, was called "outrageous," and it was alleged that property had reached its full value in the City, and must go down. It was contended that the price, 2,500*l.*, was most extravagant. In consequence of Mr. Sheriff Dakin being one of the directors of the company, Mr. Humphreys, the Middlesex coroner, presided before a special jury, and placed the case before them. The jury retired, and on their return assessed the compensation at 2,450*l.*

IRELAND.

Dublin.—There is at present a cry out for a new theatre for this city. Last year Mr. Boucicault and a few others made some overtures, with this purpose in view. It seems to have fallen to the ground; but now that Mr. Boucicault has again visited Dublin, where he has produced an original piece, many are giving expressions in the newspapers and otherwise to their views, concerning the insufficiency of the present theatres, two in number,—too few, and in the matter of necessary appliances far behind the age. There is a great want of one,—not, indeed, so large as the Theatre Royal, the better of the two, but of the shape and with the arrangements of the Haymarket, in London. It is to be hoped that something good will result from the present agitation of the subject. One writer uses language rather strong, but on the whole not groundless, and describes the theatres of this city as a disgrace to civilization. He also makes the remark that large theatres are a mistake.

St. Andrew's New Church, Dublin.—The church which gives its name to the wealthiest and most central parish of this city, is now progressing satisfactorily. There has been some delay, pending alterations on the original design, and the prospect of funds sufficient to carry them out in their integrity. A Dublin gentleman had, about a year since, anonymously offered a sum of 1,000*l.* on condition that the committee should have the sum of 1,600*l.* collected on or before the 1st of October, 1864, which would make up the balance of the sum necessary to carry out the design of the Messrs. Lanyon, Lynn, & Lanyon, amounting in all to 12,600*l.* Notwithstanding the efforts of the committee and their clerical officers, not half the required amount has been obtained, and the offered sum has been withheld; the church will in consequence have to be left in an unfinished state, divested of that which in the design, as exhibited, attracted the attention of all who have seen it, namely, its tower and cloister porch. Although the architects already named have designed the church, and are carrying it out, they are obliged to act under the supervision of the Irish Ecclesiastical Board and their professional officers, because a certain limited proportion of the cost is to be defrayed by them. The arrangement is one that does not give universal satisfaction, inasmuch as it is doubted whether the officer of the above-mentioned commissioners is necessarily qualified to direct or control an architect whose education and studies are entirely directed to his own profession.

Eyrecourt, county Galway. — A new church (R.C.), is just completed here: the cost is about 1,800*l.* Its proportions are,—Nave, 85 ft. long, 24 ft. wide; sanctuary or chancel, 22 ft. by 20 ft.; two transepts, each 30 ft. by 20 ft.; a chapel, 15 ft. square, on either side of chancel; and a sacristy. The style is Early English; the chancel window and those of transepts will be of large dimensions, and be ornamented with tracery. The roof timbers will be exposed, wrought, stained, and varnished. To the above are added a bell-tower of moderate height, a porch, and a baptistery. The stone of the locality has been used.

PROVINCIAL NEWS.

Wanstead.—A large hall, designed by Mr. T. H. Lewis, has recently been commenced for the use of the children of the Orphan Asylum, when debarred from open-air exercise, and for public examinations, lectures, &c. Lady Morrison, who provides the hall, laid the foundation stone of the building.

Glastonbury.—A new assembly-room has been erected here. The new hall is 55 ft. long, 35 ft. broad, and 21 ft. high, and is something after the shape of the old hall at Westminster. It was built for 700*l.*, by Mr. Merrick, of the town.

Leek.—The opening of the Temperance Hall, Union-street, has taken place. From 1833 until the erection of the edifice in Russell-street, it has been the chapel of the Congregationalists, from whom it has been purchased by the friends of the Leek temperance movement for 600*l.* The internal arrangements have been somewhat altered, at a cost of about 100*l.* The body of the hall has been fitted up with backed forms, and there is a new orchestra at the upper end.

Burntwood (*Staffordshire*).—The new lunatic asylum is in an advanced state of progress. It occupies a site close to the village of Burntwood, and three miles from Lichfield. The main building for the reception of patients extends westward from the dining-hall for 184 ft., having at its opposite extremity a wing at right angles to the front, with a front elevation of 37 ft. 6 in., and giving a western front of 129 ft. The whole length of the present south front is 286 ft.; but in addition to this there is a projection in the centre of the western front in an octagonal form. In the centre of the main building, between the dining-hall and the western wing, is another projection to the south front, and at this point the building runs back for some distance, and contains bath-rooms, closets, &c., whilst the north-western portion is devoted to idiots, who have a separate airing-ground. The general arrangement of the building consists of a series of large day-rooms and dormitories for the patients, all with a south or west aspect. There are on the ground-floor six day-rooms, varying from 37 ft. long and 17 ft. wide to 20 ft. long and 16 ft. wide; and five dormitories, from 28 ft. 6 in. to 16 ft. 6 in. long, and 16 ft. wide; whilst on the first floor there are four large day-rooms and a number of dormitories. All these are 12 ft. 6 in. high, and the dormitories in the attic floor, the ceilings of which are perfectly flat, and in no degree taken out of the roof—are only a few inches lower. The land and timber cost 6,963*l.*; the builder's contract was 17,555*l.*, with 325*l.* for well, 284*l.* for tank, and 2,037*l.* for engineering works, &c. The other expenses to prepare the building for the reception of patients would raise the cost to about 35,000*l.*; and if the eastern side were built—tendered for to the amount of 10,500*l.*—the whole building would cost 45,500*l.* The architect is Mr. Moffatt, of Edinburgh; and the contractor, Mr. Horsman, of Wolverhampton. The building is being erected under the superintendence of Mr. J. T. Rowland, as clerk of works.

Audley End.—The present noble owner of Audley End (Charles Lord Braybrooke), not having yet taken up his residence there, determined that during his absence the palatial seat of his ancestors should be substantially restored and improved; and the works, which have been for many months in progress, are now fast p ceeding to completion. The commencement the renovations was at the north end of t chapel, the walls of which were taken down the plinth, and wherever by time the walls h become defective they were restored with Kett stone. The restorations extend over the great part of the buildings, and what is called t "bucket" hall was entirely repaired. The gla of the chapel window, of Gothic proportions, h been preserved, but not used in these alteration and all the mullions of the windows of each fro and wing have been restored and filled in wi plate glass. The porticoes appear fresh, and their original state, and the front of the hall h been restored. Richard Aldworth, third Lo Braybrooke, and father of the late and prese lords, laid out 70,000*l.* in restorations and re vations about thirty-eight years ago.

Bacup (*Lancashire*).—The local board ha decided upon the erection of a commodio market house. The estimated cost is 5,00 The plans have been prepared by Mr. Jose Brierley, of Blackburn.

Manchester.—The ceremony of dedicating t new Freemasons' Hall, Cooper-street, the fou dation stone of which was laid in July last ye has taken place with the usual Masonic ce monial. The building has three entrances, t principal one being for the exclusive use Masons, when meeting for craft purposes. T lodge and banqueting-rooms are similar dimensions, each measuring 56 ft. by 28 ft., t former being 26 ft. in height, with a Decorat semicircular ceiling.

CHURCH-BUILDING NEWS.

Elmswell (*Suffolk*).—The chancel of the pari church, after undergoing a thorough renovatio was re-opened with ceremony on the 28th u The whole fabric is interesting, and especial the chancel, which is of fourteenth century wo A new roof has been placed upon the walls, t entire stonework carefully repaired, a vestry add upon the north side, a low stone screen plac at chancel arch, oak carved stalls and subcell tile floor, reredos covering the lower part of t east wall, and a painted east window, by Lave & Barraud, with other accessories, complete t work. The works have been carried out by M Smith, builder, of Rattlesden, at the expense the rector and his family. A spacious recto and schools are rising near the church, the wh being carried out from the designs of M Withers, architect.

Snape (*Suffolk*).—The church of Snape h been re-opened. The recent alterations ha been confined to the interior. Benches of stain deal take the place of the pews: the floor of t church has been raised; the passage down t centre paved with bricks in the place of t broken flag-stones formerly there, and the have been other minor alterations. In sever cases new stone mullions have been substitut for wooden ones in the windows, and one ne stone window has been put in the north wall the place of a wooden one: this is in the Ea English style. The west gallery, in which t school children sit, has been considerably reduce so that it no longer projects in front of the wi dows, and that part of the church is consequent lighter. Whilst the alterations at the east e were going on a piscina was found in the sou wall, and also the remains of a staircase in t thickness of the north wall leading to the l above. The whole building has had a fresh co of plaster and whitewash, and a wooden lini of the height of the benches, and stained uniformity with them, runs round the chur All the alterations have been carried out Mr. Nunn, of Friston: they were planned by t vicar with Mr. Nunn's assistance. Mr. Thurlo of Saxmundham, had the stone-work, and M J. Beard, Saxmundham, stained the wood-wo The total cost of the alterations exceeds 250*l.* large part of which is given by General Vy the patron of the living, the parishioners raisi another part.

West Ogker.—The parish church having be rebuilt, with the exception of the tower, h been opened for Divine service. The pres alterations may be described as consisting of building the north and south arcades; and in t case it is an exact rebuilding of the old, with addition of one bay westwards on the north si because the old aisle did not extend to the sa length as the nave; taking down the north ai and enlarging the same; rebuilding the chan arch; lengthening the chancel in order so

what to overcome the awkward appearance of three gables in a line; and opening the side aisles to the chancel with proper arcades instead of the square openings with lintels that were there before. The Portman aisle has simply been repaired and seated, and a larger arch made into the north aisle. The nineteenth century south aisle has undergone considerable modification. The old porch has been re-erected at the side of this aisle; and as far as funds would allow the whole has been remodelled to the same date and character as the porch, new three-light Perpendicular windows having been inserted in the south side and west end. The tower arch has been enlarged, and a screen placed in the archway, and a new west window has been inserted, under which will, probably, soon be placed a door of similar character. New open timber single framed roofs have been put to the north aisle and chancel, and the chancel roof is divided by curved ribs into three bays. The plastering between the rafters of the chancel roof has been stencilled. This and the emblazoning has been done by Mr. Stansell, of Taunton. An open timber roof has likewise been put to the nave, of near the same date as the old one, though somewhat different in character. The church throughout is seated with plain open benches, and in the nave the old oak ones have been re-used. The chancel is fitted up with oak stalls, and paved with encaustic tiles in patterns, supplied by Messrs. Maw & Co. The stained glass in the east window has been given by the rector, and in the west window by Mrs. Penny. The four windows in the south are likewise to be filled with stained glass. They are respectively given by Mr. Robert Moore, Mr. Israel Rendall, Mr. William Podger, and the working men of the parish. They will be by Messrs. O'Connor. The whole of the works have been executed from the designs and under the superintendence of Mr. M. Allen, of Crewkerne, architect, the contractor for the same being Mr. R. Bartlett, of West Coker.

Brooke (*Isle of Wight*).—The old church of St. Mary the Virgin, Brooke, was destroyed by fire in the winter of 1862, with the exception of the tower. The new church is built almost entirely on the old foundations, and consists of nave, chancel, and north transept, arranged similarly to that of St. Peter's, Vauxhall, with a central column, one-fourth of which is screened off to form a vestry. The church is built of the native rubble with dressings of green Niton stone. The chancel is lined with alternating courses of green stone, chalk, and red iron-stone. All the roofs are open, of red deal. All the windows are filled with grisaille glass, by Lavers & Barraud, that over the altar containing the Crucifixion. The nave is seated with open benches of elm, and the chancel stalled in oak.

Whitbourne. — The work of restoration and enlargement of the church here is about to be commenced forthwith, funds almost sufficient for the purpose having been raised, and plans furnished by Mr. Perkins, architect to the Dean and Chapter of Worcester. The western gallery will be swept away altogether, and in lieu thereof a new north aisle is to be added, which will accommodate some 100 persons, and a new vestry will be built. New open seats are to be furnished for the nave, and new stalls for the chancel, with altar-rails and other necessary furniture, including a reading-desk and stone pulpit. It is hoped also to raise funds sufficient to complete the work by the external repairs that are necessary, and also to provide a warming apparatus.

Worcester.—A parish meeting, convened by the committee recently appointed to consider whether any and what works of restoration and improvement are desirable to be carried out on St. Nicholas's parish church, has been held. The committee have consulted Mr. W. J. Hopkins, of this city, architect, and an engraved plan, showing the alterations recommended by Mr. Hopkins, was put in the hands of the parishioners, together with his descriptive report, in which he says that the present state of the church is very unsatisfactory; for, as well as being greatly in need of general reparation, it is exclusive and unecclesiastical as regards its arrangements, is badly lighted, badly ventilated, and badly warmed.——The Shrub Hill Church is now gradually rising. The timber-work of the roof of the lately-destroyed Guesten Hall appears over the nave, and will be lighted up with a rose window in the western wall. This window is a design by the architect. The rose, or wheel, has radiating mullions terminating in cinquefoils, and in the centre is a triple tau, as an emblem of the Trinity. The window being a Pointed one, there is tracery above the rose, entwining itself in two triangles, having flowing instead of straight sides; and in the spandrels formed between this tracery and the rose are smaller circles cusped. A double doorway underneath this west window forms the principal entrance: it has a central shaft and trefoil heads to the arches, the main arch being of three orders, the mouldings of which are distributed upon as many recessed shafts. Some of the north windows of the nave are copies of those in the late Guesten Hall. Three acutely-pointed arches divide the nave from the south aisle, which has a lean-to roof. There are north and south transepts, with a chapel or recess at the east end of each, one of which is for the organ and vestry, and the other for school children. The chancel will be of the same lofty proportions as the nave, and the apsidal east end has five windows in the apse, each of three lights, and Decorated tracery. At present the chancel is not so far advanced as the nave, but the work is up to the centre of the windows. Mr. Hopkins is the architect, and Mr. Nelson the builder.

Nempnett (*Somerset*).—The parish church of Nempnett has been re-opened, after having undergone a restoration. The floors have in part been laid with Minton's tiles. The seating is all open, with bench ends, designed from a fragment found under the modern floor. The windows have been refilled with tracery made out from broken fragments built into modern walls. The pulpit is of oak—designed to harmonise with the fittings. All whitewash has been removed, and the original faces of stonework brought out without scraping or cutting. The plaster ceiling is taken away, and the decayed timber of the roofing removed and renewed, and the bosses etched with gold. The old carvings under the trusses were found on removing the lime to retain the original colouring. The chancel, which is very plain, has been fitted up with stalls, and the ceiling and walls tinted. The work has been executed from the designs of Messrs. Popes & Bindon, by Mr. Morris, of Bristol, assisted by his sub-contractors, Mr. Wilkins & Mr. Cowlin.

Kirk Sandall (*Doncaster*). — St. Oswald's Church, Kirk Sandall, has been reopened. Coats of plaster and limewash have been removed, and the walls are presented to the view. Mr. Teale, of Doncaster, was the architect employed.

Bradford.—Holy Trinity Church, the seventh of the ten to be built by the Bradford Churchmen in five years, has been consecrated by the Bishop of Ripon. The church is situate in the midst of a large population at New Leeds, a suburb of Bradford; will afford accommodation for about 600; and is built in the Early Decorated style, from the designs of Mr. Paley, of Lancaster, at a cost of about 3,000*l*.

ACCIDENTS.

In High-street, Birmingham, at a spot where premises were burnt down and excavation was going on, a wall bulged out and fell, covering up two girls, who were bruised but not seriously injured. Other seven persons made their escape just in time. The wall had been "secured," but the foundations had been disturbed.

At Liverpool a terrific gas explosion has taken place in the office of the United Kingdom Telegraph Company. The office is a perfect wreck. Some slight personal injuries have been sustained.

At Maryport the front wall of an old house at the bottom of Old Market Brow, familiarly known as Ben Sanderson's Corner, has fallen. It appeared, for some time past, in a rickety state. Still the occupant, a sailor, continued to remain there; and, although the family were all in bed when the house fell, they sustained not the slightest injury.

At Sheffield lately, while a temperance meeting was being held in some workshops, a large portion of the floor gave way and precipitated about 150 people into the shops beneath. After the first alarm had subsided, it was found that the worst injury sustained was a broken leg.

Near Lymm, at the new bridge in course of erection over the river Mersey, at Warburton; some planks, which do not appear to have been properly secured, slipped from a temporary scaffolding; and a young man was precipitated into the river and drowned.

At a lone farm-house near Murat-le-Quaire (Puy-de-Dome), a farmer, having purchased 15 kilogs. of blasting-powder for quarrying, was so imprudent as to lay it to dry on the floor before the fire, while six persons, composing his family and himself, were in the room. The powder exploded, blowing down the house, and setting fire to the adjoining buildings. All the persons escaped from the ruins, but so severely burned that their recovery is considered hopeless. The house, outbuildings, and corn-stacks, were entirely consumed, and nine cows and twenty sheep perished in the flames.

Books Received.

James Brindley and the early Engineers. By Samuel Smiles. London: John Murray, Albemarle-street. 1864.

The Story of the Life of George Stephenson; including a Memoir of his Son Robert Stephenson. By Samuel Smiles. London: John Murray. 1864.

These little volumes, full of matter, each a distinct work, are reproductions, in a cheaper and more compact form, of parts of Mr. Smiles's larger work, "Lives of the Engineers," of which we gave a full account at the time of its appearance. The present arrangement places the most interesting information contained in it within the reach of a much more numerous body of readers, and will be doubtless taken advantage of to a large extent.

Since the appearance of the first edition of the "Story of the Life of George Stephenson" additional information has been communicated to Mr. Smiles, and incorporated in the present issue. It does not seem to have led the author, however, to lessen the share of merit attributed by him to the Stephensons in respect of the railway and the locomotive, concerning which there continue to be two opinions.

The Life of Brindley, forming a companion volume, includes memoirs of the earlier engineers, Vermuyden, Sir Hugh Myddelton, and Captain Perry,—of whom in connexion with the Thames dykes we have recently had occasion to speak. The story of the "ineloquent Brindley," one of the most remarkable instances of self-taught genius to be found in the range of biography, is full of teaching, full of encouragement, and is admirably set forth by Mr. Smiles.

Both volumes are illustrated with engravings, and are very attractive and valuable.

VARIORUM.

We must mention, pending the full examination of the book, the publication, by Mr. Murray, of "A new History of Painting in Italy," in two volumes, by J. A. Crowe and G. B. Cavalcaselle, whose work on the Early Flemish Painters we have often taken occasion to refer to. Their new book purports to be drawn up from fresh materials and recent researches in the archives of Italy, as well as from personal inspection of the works of art scattered throughout Europe. The present two volumes are but an instalment of the whole intention, comprising the History of Painting complete to the close of the fourteenth century, and partially so to the end of the fifteenth. Two subsequent volumes will bring up the history to the time when "the tide of the great Revival halts at the full."——"Naudin's Portfolio," edited by Hamilton Hume, is to present the public, monthly, with a collection of photographic portraits and biographical memoirs of men and women who have made themselves celebrated in the various walks of life. No. 1, now before us, comprises a large photograph of "Gadshill," the country seat of Mr. Charles Dickens, with a group on the lawn consisting of Mr. Dickens, Mr. Fechter, Mr. Wilkie Collins, and others. It also contains photographs of Mrs. Henry Wood (the authoress of "East Lynne"), Mr. Tom Taylor, Mr. Benjamin Webster, and Captain Blakeley (inventor of the Blakeley Gun). The idea of giving views of the country seats of individuals in whom the public is interested is a good one; but in this first instance has not been carried out quite so well as might have been the case. The view is all so dark that the members comprising the group can scarcely be recognized.——The *Social Science Review* for the month is devoted to an account of the York Congress of the Social Science Association, and gives a fair *resumé* of the proceedings.——Messrs. Day's reprint of the first folio "Shakspeare" of 1623, by aid of photo-lithography, has now reached Part V.——Mr. Collingridge has issued, as usual, his "City Diary and Almanac" for 1865. A little more space for each day's entry would be an improvement.

Miscellanea.

Society of Arts.—The hundred and eleventh session of this society commenced on Wednesday evening. Mr. William Hawes, chairman of the council delivered the opening address.

The Sliav-Igrine Inscription.—The Rev. J. Graves informs us that his correction at the end of the name cut on the stone (a C for a crossed out D) imitated ingeniously by our printers (p. 789), was merely a correction (twice occurring) of a mistake of his own in writing: it should stand simply as C, but reversed, Conic having so carved it.

The Calcutta School of Art.—This school, which has hitherto been somewhat mismanaged, is about to take a new start, on more strict and intelligible principles, and under the chief direction of a gentleman experienced in the management of Art-schools in England, according to the *Engineers' Journal* of Calcutta, which has a leading article on the defects and abuses that had crept into the school of late years. The French "plaster professor," it is stated, has been removed, and other improvements are being effected. What good has been done is said to be chiefly owing to the assidnity of the head master, Mr. Garrick, since the beginning of 1860.

Primrose-hill Shakspeare Memorial.—At the last meeting of the Executive it was reported that the Council of the Amalgamated Engineers had expressed a willingness to include some notice of the movement in their next quarterly report to the associated branches throughout the United Kingdom and the colonies, and the council would further supplement such notice by commendatory observations of their own. Mr. G. L. Banks reported a letter received from Messrs. Falconer & Chatterton, of Drury-lane Theatre, to the effect that every person engaged upon or about that establishment, including the company, orchestra, scenic artists, ballet, stage carpenters, property-men, supernumaries, money and check takers, box-keepers, cleaners, bill-posters, &c., in all 1,198 persons, had left subscriptions in the treasury on behalf of the Shakspeare Memorial Fund. The formation of a committee in aid, in the parish of Islington, was reported.

A Compositor's Leisure.—Amongst many interesting and curious items in the recent North London Industrial Exhibition, either encased or otherwise placed so as not to obtain examination by ordinary visitors, we would mention a volume titled "Autumn Rambles in the County of Kent," by Wm. Dampier (for some years a compositor in the printing-office of Messrs. Cox & Wyman, Great Queen-street, and now in the service of Mr. Hardwicke, the West-end publisher), consisting of 250 pages of manuscript and upwards of 100 views and maps. It was commenced in 1859, and completed in June, 1864; the whole of the compilation, writing, and delineation having been executed by him during leisure moments, before and after business hours. The adjudicators gave the author a first-class prize; and we should be glad if this mention of his work should assist him in finding a purchaser for it.

Workmen's Societies in Germany.—The subjoined is extracted from a Leipsic letter:—The congress of the workmen's societies of Germany has just met here. The question of workmen's houses was the subject of interesting communications from Professor Huber, who honoured the congress with his presence, and from M. Hegne, a great building contractor, of Leipsic, who with his own funds has erected a number of houses for the residence of artisans near the city. Like the Dolfus Society at Mulhausen, he gives workmen the opportunity of purchasing the houses they occupy by annual payments. The same builder is on the point of making a canal from Leipsic to Saale, for which he himself will find the capital. Unfortunately, instead of encouragements he meets with nothing but obstacles on the part of the bureaucracy and official architects, always jealous of their own initiative infallibility. The members of the congress devoted two hours to visiting M. Hegne's houses for workmen. The congress decided on recommending the establishment of lodging-houses for travelling artisans, and charged the managing committee to centralize in offices its demands for employment and offers of work.

Altar Cloth.—Messrs. Frank Smith & Co. have executed a richly-embroidered altar cover, designed by Mr. A. W. Blomfield, for the Radcliffe Infirmary Chapel, Oxford. It is a very satisfactory production both in respect of design and execution. The cost was 50*l*.

The Wallace Tower at Stirling.—This monument has now attained a height of 140 ft., leaving only the open crown at the top and the keeper's-house and the court-yard below to be completed. It is calculated that the entire design can now be completed for 3,000*l*., and an appeal is made for farther support to the committee in carrying the enterprise to a satisfactory termination.

Church Extension in Leeds.—In May last it was announced that 25,000*l*. were ready to be subscribed for this purpose, on condition that a like sum was raised within six months. At a recent meeting it was announced that 28,327*l*. had been so subscribed, and that, therefore, the fund already available for church extension, in Leeds, is 53,327*l*. The meeting resolved still to go on with the subscription.

Exhibition in Copenhagen.—A committee appointed to inquire as to a general exhibition of the manufactures and works of art of all the Scandinavian states, in Copenhagen, has just published a report, in which it is proposed "That an exhibition of the products of the three Scandinavian states—Sweden, Norway, and Denmark—should take place in the summer of 1866, and that for that purpose a crystal palace should be constructed at the expense of the state and of the capital."

Prevention of Explosions in Kitchen Boilers.—A patent has been taken out by Mr. J. Cookson, plumber, for this useful purpose. A small open cistern is fixed anywhere convenient to the fire-side on a level with the boiler, and supplied with ball-tap. A spindle valve is fixed in this cistern, the spindle working upwards with a ball or float attached to it, so that the water, rising in the cistern, lifts the ball and closes the valve. A pipe runs from the boiler into the chimney, or where convenient, with a similar valve; and when this valve is open, the pipe acts as an escape or steam pipe. The whole is said to be easily attached to existing apparatus, or to any heating apparatus, for the prevention of explosions.

Academy of Sciences.—At the last sitting M. Becquerel read a paper on the preservation of cast iron and iron in fresh water. He had previously shown that when a plate of either material was in contact with a zinc plate not exceeding the hundredth part of the surface of the former, the intensity of the derived electrical currents on the protected metal (iron) would, in sea water, diminish as the distance from the point of contact of the two metals increased; but nevertheless so that the protection afforded by these derived currents would still extend to a considerable distance from the said point of contact. In fresh water there are fewer divided currents on the surface of the metal, a fact which M. Becquerel attributes to the difference of conductability of the two liquids and the degree of chemical action which each exercises on the zinc, since these two circumstances both tend to increase the intensity of the currents. M. Becquerel concludes with saying that a pile of 9,837 cannon-balls, 12 centimètres in diameter, may be protected from oxydation under water by surrounding it with zinc bands having an aggregate surface of two square mètres.

Belfast: Proposed Street Improvements.—Belfast contains certain narrow straits overcrowded at times by a trading community. The town progresses at the rate of 1,500 houses yearly. New streets, factories, warehouses, banks, shops, and public buildings, are rising on every side; while new docks and railway connexions will stimulate still more its progress as a great emporium. The question, therefore, has been started, What shall be done with these "throttled" arteries, which are daily growing worse? Having regard to this state of affairs, the borough surveyor has prepared a plan (of which the council have approved), which contemplates gradually carrying out the most needed improvements as opportunity may arise. It is proposed to widen existing streets as houses are rebuilt, only one side being taken down, where possible. The council are empowered to devote 1,500*l*. a year to forming a sinking fund for the purpose.

Weston-super-Mare.—Among the new works and improvements here are the Government fortifications and harbour at Brean Down, which were lately inaugurated; the new pier at Birnbeck, just commenced; the Weston-super-Mare and East Somerset Hospital; a new passenger-station, cost, 20,000*l*.; a new terrace at Claremont; new buildings on the South Parade for the West of England banking establishment and for Stuckey's banking company; new waterworks at Worlebury; new houses for the Coast-guard men; a covered riding-school; and shortly, probably, a new parish church.

Roman Remains at Shepton Mallet.—An interesting discovery has been made on part of the site of the New Brewery, now being erected at Shepton Mallet. In making an excavation the workmen came down upon a Roman kiln, or oven, used for baking pottery, numerous examples of which were found, several of them being very nearly perfect, never having been used. The kiln is to be preserved entire. This will be accomplished by turning a solid arch of masonry over the whole, to which access will be given by means of stone steps from the surface.

Hardening Cast Iron.—A patent has been taken out for a new method of hardening the surface of castings. When the piece is filed up, or otherwise finished, it is brought to a cherry red heat, and then immersed till quite cold in a solution composed of 1,080 grammes of sulphuric acid, and 65 grammes of nitric acid to 10 litres of water. It is added, that the thickness of the stratum hardened is sufficient for all ordinary purposes, and that the iron suffers no distortion.

Pumpology.—A handsome pump has been erected at Blandford, Dorsetshire, in which has been inserted a tablet inscribed as follows:—"Erected for public use by Thomas Horlock Bastard, and dedicated by him to the memory of his esteemed friends, George Coombe and Andrew Coombe, M.D., and of their zealous efforts to diffuse a knowledge of the human constitution and of the laws of nature as conducive to the preservation of health and the advancement of morality. October, 1864."

The Chorlton Hospital Contract.—The local guardians have had a long discussion relative to the advisability of placing the work in the hands of Messrs. Warburton, Brothers, as recommended. The committee, on the whole, were of opinion that the contract might be safely intrusted to the builders in question. Mr. Hereford said Mr. Worthington, the architect, and Mr. Taylor, the surveyor to the Board, had both asserted that it was impossible that the contract could be satisfactorily completed for the sum of 15,000*l*. That being the case, there would be a direct temptation to the builder to put in bad work and materials; and they could not guard against that, even though they were to place a clerk of the works at each corner of the building. Mr. Gawthorne said the main question with the committee had been whether they could save the 2,000*l*. difference between the tenders of Mr. Robert Neill and Messrs. Warburton. The strictest surveillance would be exercised, and there was reason to hope that the contract would be executed to the satisfaction of the guardians. On a division, a majority of thirteen against five voted in favour of the acceptance of Messrs. Warburton's tender.

The Sheffield Inundation.—The machinery that was created by Act of Parliament for the relief of the sufferers by the Sheffield flood has now got into working order. This measure constituted a commission for the ascertainment and assessment of damages, and Mr. William Overend, Q.C., was appointed chief commissioner, at a salary of 2,000*l*., and Messrs. J. J. Smith, of Sheffield, manufacturer, and Mr. F. Mills, of Duckmanton, Derby, were named as his colleagues, at salaries of 1,000*l*. each; and a clerk of the court was appointed at 700*l*. The commissioners sit in Sheffield. They have the fullest powers for the discharge of their peculiar duties, and there is no appeal from their decisions. As was anticipated, the number of claims sent in has been enormous. The 29th of October was the last day allowed by the Act, and on the evening of that day the claims numbered 7,200. The aggregate amount of the claims is said to be more than 500,000*l*., but a vast number of the claimants are accepting the sums offered by the water company, and others have found their own estimate of the damage materially reduced by the commissioners.

FURTHER DISCOVERIES AT KEISS.—The tomb of other chief has been discovered at Stain, near aiss, in Caithness-shire. It has the hitherto noticed form of a square enclosure. The eleton is 6 ft. 2 in. long, so that if this were a ief among the little people of the stone era, as is called, they might well have held that here were giants in those days." The skull is id to be of a very low type. Many stone weapons ere found in the cist or tomb, which is based n an ancient sandy sea-beach, and filled with ravel. Similar implements, as lance heads, atchet, hammer, &c., have elsewhere also been und.

THE LOCAL GOVERNMENT ACT AND IMPROVEENT OF TOWNS.—A committee has been apointed by the Bristol Council, to consider the ropriety of adopting this Act in the city of ristol. At Ulverston the Act has been dopted, after repeated attempts to introduce . Dr. Lankester had been lecturing the inhaitants on their sanitary necessities, and on the auses of the heavy mortality of the town. The ajority of the ratepayers in favour of the introuction of the Act, however, was only forty-one. t Bangor, a seaport town in Ulster, Ireland, he Towns Improvement Act has been adopted, mid great rejoicing, illumination with tararrels, &c.

THE DOCKYARD EXTENSION AT CHATHAM.—Progress under the convict system is so slow here, that it has been calculated the extension works will not be completed before the year 900, unless something be done to facilitate perations. The *Chatham News* remarks, that his would not matter much were the extension ittle needed, but that in reality it is already required. The site of the whole extension overs 300 acres, and the basin accommodation will be unparalleled, and the factories Cyclopian in proportions; but at present there is ittle to see, as the results hitherto are excavaions and foundations merely, and are buried in he earth.

LENOIR'S GAS ENGINE.—This engine is not intended as a substitute for the steam-engine, but as a means of obtaining the equivalent of steam-power in cases where the use of steam could not be admitted. In outward appearance the Lenoir gas-engine does not differ widely from that of a horizontal steam-engine; but, with the gas-engine, the necessity for boiler and furnace, with the accompanying expense of stoker and fuel, does not exist. The power is generated within the cylinder itself; and, as no more is generated than is actually required for the stroke to be made, there can be no waste whilst the engine is at work, and the expense will cease entirely the instant the engine is stopped. After lying some time in abeyance, the development of Mr. Lenoir's invention in this country has been undertaken, it is said, and will be energetically carried on, by the Reading Ironworks Company, who propose to construct the machine in four sizes, from ½-horse to 3-horse power, the price of which will vary from 55*l.* to 125*l.*; and these amounts include the electric apparatus connected with the machine, which will require only the gas to be turned into it to set it to work. An annual royalty of from 2*l.* 2*s.* to 3*l.* 3*s.* is charged for the right to use the engine during the continuance of the patent; but this may be commuted by a small immediate payment.

DESTRUCTION BY FIRE OF THE GRAND JUNCTION WATER-WORKS.—To attack water-works is about as impudent a thing as fire can do: it is almost as bad as setting the Thames on fire, which, by-the-bye, old Van Helmont declares was often done when ships were supplied with Thames water, which first stank and then the vapours could be set fire to, when the water became quite pure again. The fire at the Grand Junction Water-works broke out in one of the engine pumping-houses connected with the company, at Notting-hill. The engine was in full operation at the time; and, on the alarm being given, the fire was found to have possession of the interior. The company have hydrants fixed in various parts of the works in case of fire; but of course, as in all such cases, they were not available: the lever for turning the water on them was fixed in the pumping-house itself, and the workpeople were hence unable to get at it on account of the place being in flames, and had to wait until the arrival of engines. By that time the fire had done its work, the roof had fallen in, and the place was a general ruin. The origin is attributed to the overheating of a steam-pipe. The works, it seems, were uninsured.

A NEW WAY OF PRINTING.—The description of a very rapid process for reproducing pencil drawings has been going the round of the Russian journals. The process will be particularly useful in campaigns, where it is often desirable to have a number of copies of a hasty pencil sketch. Some time ago M. Villani-Villanis remarked that if a sheet of paper on which a plan or any drawing or writing has been executed with pencil be moistened with acidulated water, and afterwards inked, the pencil marks alone will take the ink, and the whole drawing may then be transferred to metal or stone.

GIBRALTAR CATHEDRAL.—The first of a series of twelve stained glass windows has recently been placed in Gibraltar Cathedral. The cathedral is in the Moorish style of architecture, and the windows are each in one large compartment, with horse-shoe arch head. In the lower part of the window, which has just been completed, is represented the figure of St. Peter within a vesica, and in the upper or horse-shoe head, within a quatrefoil, St. Peter walking on the sea. The ground part and borders of the window are of geometrical work, arranged from patterns on the walls of the Alhambra. At the bottom of the window is the following inscription:—"To the Glory of God, and in memory of George Tomlinson, D.D., first bishop of Gibraltar, instituted 1842." The window is the gift of the present Bishop of Gibraltar, and is the work of Messrs. Horwood, of Mells, near Frome, who have also others of the series in course of construction.

URICONIUM.—In the report of a visit by the Liverpool Naturalists' Field Club to Shrewsbury and the site of ancient Uriconium, the ruins are thus described:—Arrived at the wicket which leads us to the ruins, we enter upon what at first would suggest the foundations for an extensive range of buildings, the erection of which had suddenly been cut short by want of funds. A closer inspection soon shows that they have vastly more significance. First, to our left is a cellar which has apparently been used by a Roman smith or enameller. There is a rude stone anvil, and also equally rude remains of a furnace. To the right is a square inclosure, said to have been a market-place, and to the entrance of which are two stone steps greatly worn, as if leading to a place of great public resort. Farther on we next enter upon a long series of hypocausts, consisting originally of a thick flooring of composite, resting upon piles of red tiles, and forming a series of passages through which hot air from a common furnace circulated and warmed the rooms, or baths, as the case might be, above. Several specimens of pavements have been discovered, in both red and white tiles; and in one instance some stucco-work on one of the walls had been preserved. Dr. Johnson pointed out an ashpit, in which they discovered pottery, coins, &c.; also, a square hypocaust, in which the skeletons of three persons were found, one in a crouching position, and near to which lay a small heap of coins, the dates of which ran from Tetricus to Valens. This led to the supposition, corroborated by other data, that it was about the year 350 that Uriconium was destroyed. Other human remains, found in various parts, showed that the slaughter at the sacking of the town must have been fearful. The excavations extend over a space of two acres, but two-thirds were again filled up. The ruins of the city are supposed to cover an area of three miles in circumference. The old wall, which rises to a considerable height, stands like a guardian of the abode of the dead; and well it has kept its trust for fifteen hundred years.

ARCHITECTURAL ASSOCIATION, VOLUNTARY EXAMINATION CLASS.—The class will meet on Tuesday next, the 22nd inst., at 7·30 p.m. as usual, when Mr. Thomas M. Rickman will treat upon "Gibbon's Law of Contracts."

TENDERS.

For alterations at the corner of Castle-road, Kentish Town. Mr. James Harrison, architect:—

In One Volume, demy 8vo. price 18s. illustrated with numerous Plans, Sections, and Sketches of Gardens and General Objects, a New Edition, greatly enlarged, of

HOW TO LAY OUT A GARDEN.

Intended as a General Guide in Choosing, Forming, or Improving an Estate, from a Quarter of an Acre to a Hundred Acres in Extent.

By EDWARD KEMP, Landscape Gardener, Birkenhead.

"When noticing this work on a former occasion, we expressed our belief that it was one of the best books on pure garden design in the English language. Our opinion remains unchanged. There may indeed be more learned and classic works on the subject of landscape gardening; but we doubt if there is one that contains so much useful information and practical details, relative to the laying out of a garden, as are to be found in this unpretending volume."—*Gardener's Chronicle.*

BRADBURY & EVANS, 11, Bouverie-street, E.C.

Reduced from 4l. to 20s. carriage free 22s the remaining copies (only 120) of

LITTLE CASTERTON FREESTONE.
Apply, for prices, &c. to
OCTAVIUS N. SIMPSON, STAMFORD,
The Owner; and see Specimen at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect oolite) is raised in blocks of any portable size, and is about 4 feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the Kingdom.
*** The above WEATHER STONE is used largely by London Builders.

Can be seen in the Constructional Department,
KENSINGTON MUSEUM.
R. LANGLEY, Agent.

TO BRICKMAKERS.—All Parties wishing BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr. ROBERT WHITE, and which may be seen in operation at the Brick-fields of
J. B. WHITE & BROTHERS, Erith, Kent
The advantages of this plan are two-fold.
1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the whole make, which in itself represents a large permanent saving.
2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.
Licences for use of the Patent granted to Brickmakers, on application to the Patentees 17, Millbank-street, Westminster.

HONDURAS WHARF AND FALCON WHARF,

READE & HEWITT'S PATENT PNEUMATIC PAN and SELF-ACTING WATER CLOSETS, RAILWAY URINAL, and SEWER FLUSHING APPARATUS.
The simplest, strongest, and cheapest Closets manufactured, acting efficiently with or without Supply Cistern, and at high or low pressure. Specially adapted for railway stations, offices, public buildings, workshops, and any situations where subjected to severe usage. Prevents waste of water, saves piping, cranks, wires, service-box, and all the complicated apparatus of self acting closets.
The Self-acting Pneumatic Flushing Vessel flushes ranges of urinals regularly at intervals, the time between the discharges being regulated by a simple tap, thus saving an immense quantity of water, which ordinarily runs to waste.
Best Pan Closet, complete £2 12 6
Best Self-acting Closet, complete 2 15 0
Railway Urinal Flushing Vessel, complete 3 3 0
LIVERPOOL, CANNING CHAMBERS, 4, SOUTH JOHN STREET.

SHIPMENTS ON THE SHORTEST NOTICE.

HYDRAULIC LIME and ROMAN CEMENT, manufactured by LLOYD JONES & CO. Halkin Works, Holywell, Flintshire. The Halkin Hydraulic Lime is the same as used in the construction of Liverpool Docks, Manchester, and various waterworks, collieries, and mines throughout the country, being so long celebrated for its strong cementitious and congealing powers for masonry in water. Can be supplied by rail or water to any part of the kingdom, either in lump (loose), or ground, and in barrels and bags. The Limestone can be had in full cargoes, also their Cement in barrels, which is of a very superior quality and warranted pure. Orders to be accompanied by a banker's reference. Apply at the Works; or to E. & W. AARON, Agents, 66, South John-street, Liverpool.

PORTLAND CEMENT WORKS,
NORTHFLEET, KENT.
ROBINS & CO.
To whom the Prize Medal was awarded in 1851, are prepared to supply any quantity of the very best PORTLAND CEMENT, manufactured by them for all purposes to which cement is applicable.—Orders received at Great Scotland yard, Whitehall, and at the Works.

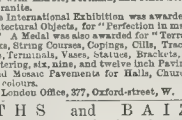
SEASONED WAINSCOT OAK,
30,500 feet in Plank and Board, sawn three years.
E. BUTTERWORTH,
ALUM STREET TIMBER YARD, MANCHESTER.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 21 Wharf, Macclesfield-street North, City-road Basin, N. Sndly, that the trade term, "TERRO METALLIC," is the exclusive right of the Proprietor; and 3rdly, that the "Reports of the Juries," page 581, of the Great Exhibition, 1851, note the grant of a First-class Medal and rank the Manufactories known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.



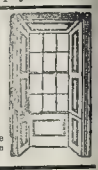
TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION
MAGNUS'S ENAMELLED SLATE
obtained the Medal of the Society of Arts; the Prize Medal at the Great Exhibition, 1851; Two First-class Medals at the Paris Exhibition; and Two Prize Medals at the International Exhibition of 1862.
Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.
Chimney-pieces, Billiard-tables, Table-tops, Baths, Wall-linings, &c. a New Illustrated Catalogue of which can be had at the Pimlico Slate Works, 39 and 40, Upper Belgrave-place, Pimlico, S.W.

PRIZE MEDAL TO MAW & CO. INTERNATIONAL EXHIBITION, 1862.
IMPERISHABLE TESSELATED PAVEMENTS, combining a highly decorative and economical substitute for ordinary floors of their perishable coverings. MAW & CO.'S Pattern-book, designed by M. Digby Wyatt, esq. together with a special design and estimate of cost adapted to any given dimensions of hall, passage, conservatory, verandah, frieze, &c. will be sent on application to Benthall Works, Broseley, Salop.
May be seen at the Exhibition of Building Inventions, &c. now open at the Galleries of the Architectural Exhibition, 9, Conduit-street, free.
London Agents—W. B. SIMPSON & SONS, 456, West Strand, who have on view a great variety of Specimens of the Pavements.

TERRA COTTA and Fine STONEWARE POTTERY, warranted to stand Frost.
JOHN M. BLASHFIELD, STAMFORD POTTERY, STAMFORD, LINCOLNSHIRE, has greatly improved and economised the manufacture of TERRA COTTA and Fine STONEWARE for ARCHITECTURAL PURPOSES. He is able to make it of various new colours, so as to harmonize with Marble, Portland, and other Stones, and equal in hardness to Granite.
A Medal at the International Exhibition was awarded, in Class 10, Section C, Architectural Objects, for "Perfection in manufacture and beauty of form." A Medal was also awarded for "Terra Cotta."
Moulded Bricks, String Courses, Copings, Cills, Tracery, Balusters, Capitals, Crosses, Terminals, Vases, Statues, Brackets, Consoles, Garden Edging, Guttering, six, nine, and twelve inch Paving Tiles, &c. &c.
Also Plain and Mosaic Pavements for Halls, Churches, Conservatories, &c. in all colours.
London Office, 377, Oxford-street, W.

CLOTHS and BAIZES.—A large assorted STOCK of the above always on hand, in all widths, colours, and qualities, at
HILL & SON'S,
Nos. 88 and 89, ST. MARTIN'S LANE, CHARING CROSS.

VENTILATION—PURE AIR.



Sheringham's Day and Night Ventilator for the admission of Pure Air
THROUGH THE EXTERNAL WALL.
These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street, Borough, London.

C. B. N. SNEWIN,
MAHOGANY, DEAL, & TIMBER MERCHANT,
11, BACK HILL, HATTON GARDEN, E.C.
Dry Hand-rail Planks, Prepared Flooring, and Builders' Goods in General.—Country orders promptly executed.

JAMES W. TYLER, CONTRACTOR FOR DEVAUX'S VIEILLE MONTAGNE THICK ZINC ROOFING,

ON IMPROVED PRINCIPLES.

12, ABINGDON STREET, and 4, WOOD STREET, WESTMINSTER, close to Victoria Tower.

stimates furnished for every description of Zinc Roofing and Guttering, inclusive or exclusive of Timber or Iron Framing, in all parts of England.
aving for several years been actively employed in laying DEVAUX'S THICK ROOFING ZINC (the purest extant) upon the new principles introduced by Mr. Edmeston, Mr. TYLER can refer ndence to work done as his best recommendation.
ood Zinc badly laid will still be a failure, for there is much more importance in the mode of laying than is yet generally known; and parties who will intrust their work to Mr. TYLER will find is important point is thoroughly attended to, and at no extra cost.
his Zinc thus laid is quite as lasting as lead, if the woodwork is arranged according to Mr. TYLER'S directions.

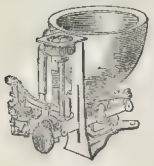
PARQUETS SOLIDAIRES. — HOWARD



& SONS, 26 and 27, Berners-street, are prepared to supply machine-made patented solid PARQUET FLOORS 50 per cent. cheaper than they have been yet offered.—Illustrated catalogues, plans, and estimates free.

GUTTA-PERCHA MILL-BANDS.—The

Gutta-Percha Company beg to state that the increasing demand for the Gutta-Percha Strapping for Driving bands, Lathestraps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractibility and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Bosses, Union-joints, Flasks, Bottles, Bowls, Toilet-trays, Curtain-rings, Galvanic Batteries, Tablotype Trays, &c. &c. manufactured by the Gutta-Percha Company, and sold by their Wholesale Dealers in town and country.

HONORABLE EAST INDIA COMPANY,
HER MAJESTY'S WAR DEPARTMENT,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANICAL GARDENS, REGENT'S PAR

And by the most eminent members of the Royal Agricultural Societies of England, Scotland, and Ireland, at whose great national s has been examined, and OBTAINED THE PRIZE, for being the best and cheapest article for roofing; also used for under slates at th Agricultural Society's House in Hanover-square. Its advantages are lightness, warmth, durability, and economy. It is impervious snow, and frost, and a non-conductor of heat and sound. The Felt can be cut to any length, by 32 inches wide. The price is on PENNY PER SQUARE FOOT. Samples, with full directions as to its uses, and the manner of applying it, with TESTIMONIALS, them of seven years' experience, from Architects, Builders, Noblemen, and Gentlemen, who have extensively used it, sent free to any the town or country. DRY HAIR FELT, for covering Boilers, &c. is also manufactured, by which a saving of about 25 per cent. i fuel is effected. The TRADE are respectfully requested to send their orders DIRECT to the FACTORY, as the surest means of being supplie a good article, and in lengths best suited to their roofs. The original works where the above roofing is made are F. McNEILL & CO.'S factories, LAMB'S BUILDINGS, BUNHILL ROW. Roofs covered with McNEILL'S FELT to be seen at the CAMPS of ALDER CURRAGH, SHOEBURYNESS, and COLCHESTER, upwards of Three Millions of Feet; also the GREAT EXHIBITION BUILDING of nearly One Million Feet. A Liberal Discount allowed to the Trade.

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used

pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.—2nd. It is portable, being packed in rolls, and not liable to damage in carriage.—3rd. It effects a saving the timber usually required.—4th. It can be easily applied by any unpractised person.—5th. From its lightness, weighing only about the square of 100 feet, the cost of carriage is small.—6th. Under slate, metal, or tiles, it is a most effective non-conductor.

INODOROUS FELT, for damp walls and for damp floors, under carpets and floor cloths. Price ONE PENNY per Square Foot

CROGGON and CO.'S PATENT FELTED SHEATHING, for Covering Ships' Bottoms, &c. and

DRY HAIR FELT, for Covering Steam Boilers, Pipes, &c. preventing the radiation of Heat, saving 25 per cent. of Fuel, and deadening Sound.

Samples, testimonials, and full instructions, on application to

Perfect sets of these much-valued Scientific Papers are extremely rare and difficult to meet with.

WILLIS & SOTHERAN'S ESTABLISHMENT for ARCHITECTURAL and ENGINEERING BOOKS, 42, Charing cross (opposite Craig's-Court).

SMITHFIELD CLUB CATTLE SHOW, 1864 (in the Gallery).—HENRY CLAYTON & CO. of the Atlas Works, will exhibit some specimens of their improved Patent Brick-making Machines, combining crushing, pugging, and moulding; Brick and tile-Pressing Machines, Combined Moulding and Pressing Machines for Fire-Bricks, Tile and Pipe Making Machines, New Pantile Moulding Machinery, Portable Mortar Mills, Patent Pneumatic system for drying bricks and tiles.—Catalogues free by post, on application at their new Manufactory, Woodfield road, Harrow-road, London, W. (late of Upper Park place, Dorset-square).

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 73—74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves, Cooking Utensils, &c. to meet the great public demand; and also for the consequent more extensive execution of all descriptions of hot water, bath, laundery, and steam work.

73—74, Bishopsgate street Within.

LENOIR'S PATENT GAS-POWER ENGINE.

PRIZE MEDAL, INTERNATIONAL EXHIBITION, 1862.

The Company are now Publicly Exhibiting this motive power, daily, between the hours of 11 and 1 and 3 and 5.

C. W. WOOD, Manager and Secretary (pro tem.)

No. 40, Cranbourne-street, Leicester-square.

COMPETITIONS.

TO ARCHITECTS.—The Committee of the Wakefield Rifle Volunteers are prepared to receive DESIGNS for the ERECTION of a DRILL SHED, ARMOURY, SERGEANTS, HOUSE, &c. A Premium of 10l. will be given for the design selected which will then become the property of the Committee, but they do not bind themselves to employ the successful competitor.—Particulars may be had at the Orderly room, Westgate, where the plans, together with a statement of the probable cost of the same, must be deposited on or before the 10th of DECEMBER.

EDWARD A. MACKIE, Captain Commandant.

5th West York Rifle Volunteers, Wakefield,
15th November, 1864.

CONTRACTS.

CLEVEDON LOCAL BOARD of HEALTH.—SEWERAGE WORKS.—To SEWER CONTRACTORS and OTHERS.—The Local Board of Health for the district of Clevedon, in the county of Somerset, do hereby give notice that they are prepared to receive TENDERS from parties wishing to undertake the following contract

Contract No. 1. For the CONSTRUCTION of BRICK SEWERS, EARTHENWARE and CAST IRON PIPE SEWERS, MANHOLES, VENTILATING SHAFTS, OVERFLOWS, FLUSHING ARRANGEMENTS, and other WORKS.

Plans, sections, details, drawings, and specifications may be seen, and duplicate forms of Tender, bills of quantities, and schedules for prices, may be obtained on and after Monday, the 21st November, instant, on payment of Ten Shillings, on application to Mr. GEORGE TURNER, Surveyor to the Local Board, Clevedon; or at the Office of Mr. JOHN LAWSON, Civil Engineer, 34, Parliament-street, Westminster.—Sealed Tenders, endorsed, "Tender for Sewerage Works," must be delivered at the Office of the Local Board, on or before TUESDAY, the 6th day of DECEMBER next. The Local Board do not bind themselves to accept the lowest or any Tender.

(Signed) HENRY WOODFORDE, Clerk to the Local Board.

Clevedon, 14th November, 1864.

TO TIMBER MERCHANTS and OTHERS. The Directors of the London, Chatham, and Dover Railway are prepared to receive TENDERS on or before the 14th DECEMBER, for the SUPPLY of 15,000 RETANGULAR and HALF ROUND SLEEPERS 10 in. by 5 in. delivered free on their Wharf at Faversham. The specification and Form of Tender may be had on application at the Office of Mr. WILLIAM MILLS, the Company's Engineer, Victoria Station, S.W. The Directors do not bind themselves to accept the lowest or any Tender.

W. E. JOHNSON, Secretary.

Victoria Station, November 23rd, 1864.

CONTRACTS.

WORKINGTON LOCAL BOARD.—SEWERAGE WORKS.—To SEWER CONTRACTORS and OTHERS.—The Local Board for the District of Workington, in the county of Cumberland, do hereby give notice that they are prepared to receive TENDERS from parties willing to undertake the following contract:

Contract No. 1. For the CONSTRUCTION of BRICK SEWERS, EARTHENWARE and CAST IRON PIPE SEWERS, MANHOLES, VENTILATING SHAFTS, GULLIES, and other WORKS.

Plans, sections, detail drawings, and specifications, may be seen, and duplicate forms of Tender, bills of quantities, and schedules for prices, may be obtained on and after Monday, the 21st November instant, on payment of Ten Shillings, on application at the Office of Mr. JOHN ASKEW, Clerk to the Local Board, Workington; or at the Office of Mr. JOHN LAWSON, Civil Engineer, 34, Parliament-street, Westminster. Sealed Tenders, endorsed, "Tender for Sewerage Works," must be delivered at the Office of the Local Board, on or before SATURDAY, the 10th day of DECEMBER next. The Local Board do not bind themselves to accept the lowest or any Tender.

(Signed) JOHN ASKEW, Clerk to the Local Board.

Workington, 17th November, 1864.

TO STONE MERCHANTS.—The Council of the Borough of Margate are willing to receive TENDERS for BLUE GUERNSEY GRANITE, as under:—

750 feet lineal of Curb, 18 inches on face by 7 inches deep.
100 feet lineal of Flat Kerb, 12 inches on face by 8 inches deep.
15 tons Pitchers, 4 inches by 7 inches deep.
3 to 40 tons of Granite in sizes to a 2 inch gauge.

The whole to be delivered in the harbour of Margate, free of all charges, within ten weeks from the day the Council signifies their acceptance of the Tender. Tenders addressed to the Town Clerk, to be sent in before ELEVEN o'clock on TUESDAY, the 6th DECEMBER next. The Council do not bind themselves to accept the lowest or any Tender.

WM. BROOKE, Town Clerk.

Margate, 17th November, 1864.

TO CONTRACTORS, BUILDERS, IRONFOUNDERS, and OTHERS.—The Directors of the Peterborough Cattle Market Company are prepared to receive TENDERS for the ERECTION and CONSTRUCTION of their NEW CATTLE MARKET, proposed to be built near the Long Causeway, in the City of Peterborough, in two distinct sections, as follows, viz:

No. 1. Comprising the whole of the Materials and Labour required in Filling, Raising and Trimming the Site, laying down the Sewerage and Drainage, and Constructing the Roads and Approaches, Stalls, Standings of Pens, Pig Offices, Pinfolds, Privies, and all other Works, and completely finishing the proposed New Market.

No. 2.—For supplying the Furnishing and Delivery and Fixing up of the whole of the Iron Castings and Wrought Iron Work required.

Or, for the Whole of the Works.

The plans and specifications, prepared by Mr. T. C. THORBURN, C.E. may be seen, and all other information obtained, on application at our Office on and after the 10th day of NOVEMBER next. Bills of quantities and forms of Tender for the Work have been prepared, and copies may be obtained at our Office on payment of One guinea for Division No. 1, and half a guinea for Division No. 2, which will be returned to parties sending in Tenders. Sealed Tenders (on the form provided) indorsed "Tender for the New Market, Peterborough," addressed to the "Directors of the Peterborough Cattle Market Company," are to be sent to our Office not later than the 6th of DECEMBER next.

GATES & PERCIVAL, Solicitors.

Peterborough, 12th November, 1864.

LONDON, BRIGHTON, & SOUTH-COAST RAILWAY.—LONDON BRIDGE STATION ENLARGEMENT, CONTRACT No. 4.—To BUILDERS and CONTRACTORS.—The Directors of the London, Brighton, and South-Coast Railway are ready to receive TENDERS for the execution of the WORKS in the side WALLS of the intended NEW ROOF, at the London Bridge Terminus, and for the ERECTION of PASSENGERS' BOOKING OFFICES, PARCELS OFFICE, and REFRESHMENT-ROOMS at the same Terminus, according to the plans, drawings, and specification, which may be seen, and the Contract obtained, at the Office of Mr. F. D. BANISTER, the Company's Engineer, on or after this date. Tenders, in the prescribed form only, and properly endorsed, must be addressed to the Secretary, and left at his Office, not later than ELEVEN o'clock in the forenoon of TUESDAY, the 6th instant. The Directors will not be bound to accept the lowest or any tender.

FREDERICK SLIGHT, Secretary.

London Terminus, 15th November, 1864.

TO IRONMASTERS, IRONFOUNDERS, &c.—LONDON, BRIGHTON, and SOUTH COAST RAILWAY COMPANY.—The Directors are prepared to receive TENDERS for the SUPPLY and ERECTION of the IRONWORK required for their New Line in Battersea, the other Works in connexion therewith, and for Batteries, New Lines, and Sidings in the Brighton Coast Railway, and to obtain a copy of the specification, schedule of price, and form of Tender (on which only Tenders will be received), and to inspect the plans, sections, and drawings, and obtain all particulars, upon application to Sir CHARLES FOX & SON, Engineers to the Company, at their Offices, 9, New street Spring gardens, Westminster, between the hours of TEN a.m. and FIVE p.m. or on Saturdays between the hours of TEN a.m. and TWO p.m. until SATURDAY, the 17th day of DECEMBER, 1864. The Tenders, sealed and marked "Tender for Ironwork for Batteries, New Lines," must be lodged at the Office before ELEVEN o'clock on MONDAY, the 19th of DECEMBER proximo. The Directors do not bind themselves to accept the lowest or any Tender.—By order,

FREDERICK SLIGHT, Secretary.

Secretary's Office, London Bridge Station,
24th November, 1864.

TO BUILDERS.—Immediate TENDERS are required for a 12-Roomed VILLA, Isle of Wight. Quantities ready on the 28th inst. on application to Mr. MARSHALL, solicitor, 7, Bedford-row, to whom sealed Tenders are to be delivered, not later than THREE o'clock on WEDNESDAY next. The lowest Tender accepted.

[For remainder of Contracts see next Page.

TO BUILDERS, BRICKLAYERS, and OTHERS—CONTRACT for BUILDING WALLS.—The Works, Build [illegible] Contract for Vestry [illegible] Parish of St. Mary Abbots, Kensington, will be OPENED, at Twelve o'clock precisely, at the Vestry Hall, Church-street, Kensington, on FRIDAY, the 9th day of DECEMBER next, at which Time and Place Sealed Tenders will be required for the [illegible] and PERFORMANCE of the WORKS [illegible] Vestry Hall, Church-street, Kensington. Tenders are to be delivered [illegible] Vestry Clerk, at the Vestry Hall aforesaid, on or before the Time appointed for opening the same. The Vestry do not bind themselves to accept the lowest or any Tender.

BRYDEN GLEED, Clerk of the Vestry.

Vestry Hall, Kensington, November 21, 1864.

NOTICE to RAILWAY CONTRACTORS.—LONDON, BRIGHTON, and SOUTH COAST RAILWAY COMPANY.—Notice is hereby given, that TENDERS for the CONSTRUCTION of the Company's New RAILWAYS in Battersea, being a length of Two Miles, or thereabouts; and for certain ALTERATIONS to the Stone Viaduct Works on the IMPERIAL RAILWAY, and other Works in the Neighbourhood, Putney, are required to submit Tenders, upon printed forms, to the Engineer of the Company, John Fox & Son, Engineers to the Company, at their Office, 8, Great Scotland Yard, Whitehall, on Wednesday, between the hours of TEN a.m. and FIVE p.m., or on Saturdays, between the hours of TEN a.m. and TWO p.m., on SATURDAY, the 17th day of DECEMBER, 1864, but no Tender received after that Time will be entertained. Forms for Battersea New Lines, must be delivered at the Office CLEAN o'clock on MONDAY, the 19th day of DECEMBER, precisely. The Directors do not bind themselves to accept the lowest or any Tender.—By order of

FREDERICK SLIGHT, Secretary.

Secretary's Office, London Bridge Station,
21st November, 1864.

TO COACH BUILDERS, WHEELWRIGHTS, and OTHERS.—The Vestry of the Hamlet of Mile-end Old Town, [illegible] Contract Vestry Hall, Alderney-road, on MONDAY, the 28th day of NOVEMBER instant, at NINE in the forenoon precisely, for receiving TENDERS for the BUILDING and SUPPLY of FIVE NEW WATER CARTS, and for the Keeping of them in Repair for Three Years according to the terms of a specification, which may be seen at the Office of Mr. JAMES KNIGHT, the Surveyor, at the Vestry Hall, between the hour of TEN and ONE o'clock aforesaid. Tenders must be required to, addressed to, and [illegible] the Vestry at the expense of the contractor,—not to exceed 6d.—and find two sureties, [illegible] Tender. Forms of Tender may be had on application at the Office. Having the names and addresses of proposed sureties written thereon at the time of delivering the Tender in the manner directed. Parties tendering [illegible] and the Vestry do not bind themselves to accept the lowest or any Tender.

THOMAS PRICE, Clerk to the Vestry.

Vestry Hall, Bancroft-road, Mile-end Road, November 1, 1864.

BOROUGH of STOCKPORT. SEWAGE WORKS.—The Local Board of Health of Stockport are prepared to receive TENDERS for SUPPLY of the several MATERIALS and LABOUR required for the CONSTRUCTION of the HEATON-LANE MAIN INTERCEPTING SEWER, together with the Storm Outlets, Manholes, Ventilating Shafts, Gullies, and the Works connected therewith. Plans, Sections, and Specifications may be seen, and copies of the Bills of Quantities obtained, on and after MONDAY next, on application to Mr. BRIERLEY, Civil Engineer, Blackburn; or to Mr. TAYLOR, Borough Surveyor, at his Offices, Tiviot Dale, Heaton Norris. Sealed Tenders, endorsed "Tender for Main Sewer," addressed to the Town Clerk, Stockport, not later than WEDNESDAY, the 30th day of NOVEMBER inst., at TWELVE o'clock at noon, must be delivered at the Town Hall, Stockport. The Local Board will not be bound to accept the lowest or any Tender.

HENRY WOODCOCK,
Town Clerk, and Clerk to the Local Board.

Stockport, Nov. 17, 1864.

TO ROAD-MAKERS and CONTRACTORS.—Persons desirous of CONTRACTING for MAKING and DRAINING ROADS [illegible] Estate, [illegible] along the Lawn [illegible] are requested to send in their Tenders on or before SATURDAY, the 3rd day of DECEMBER next. The Architect does not bind himself to accept the lowest or any Tender.

HENRY CARPENTER, Architect.

73, Coleman-street, City.

THE KEIGHLEY and WORTH VALLEY RAILWAY COMPANY.—CONTRACTS for SUPPLY of PERMANENT WAY MATERIALS.—The Directors of the Keighley and Worth Valley Railway Company are prepared to receive TENDERS for the SUPPLY of the following CHAIRS, SLEEPERS, KEYS, FISH PLATES, BOLTS, SPIKES, &c. required in the construction of the above Railway. Specification of the [illegible] required may be had on application to Mr. WILKINSON-BOOTH, C.E., Engineer, 23 and 24, Queensgate, Bradford. Sealed Tenders must be delivered to the undersigned, at the Office, on or before MONDAY, the 5th DECEMBER next. By Direction of the Committee. No Tender [illegible] any Tender.—By order of the Line.

JONATHAN GILL, Secretary.

Oakworth, Keighley, 21st November, 1864.

TO STONE MERCHANTS, DRAIN-PIPE MAKERS, MASONS and PAVIORS, CONTRACTORS, and OTHERS.—The Board of Works for the Wandsworth District are desirous of receiving TENDERS for the SUPPLY of Rockdown GUERNSEY GRANITE and other STONE and MATERIALS, and for the Supply of DRAIN PIPES in the whole of the District; also for the EXECUTION of MASONS' and PAVIORS' WORK required in the various Local Works of Improvement and Making Good Sewers and Other Roads and Local Communications in the parishes of Putney, [illegible] Battersea, Clapham, Streatham, Tooting, and Streatham, Tooting, and Balham, and Tooting, and Streatham, Tooting, and Balham, and Tooting, and Streatham, Tooting, and Balham, and

THE PRIZE MEDALS,

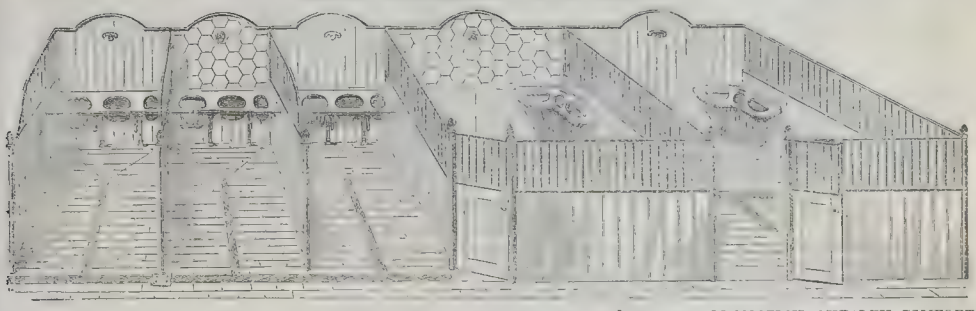
LONDON, 1851. PARIS, 1855. LONDON, 1862.

AWARDED TO

COTTAM & COMPANY,

No. 2, WINSLEY-STREET, LONDON, W.

FOR PROGRESSIVE AND GENERAL IMPROVEMENTS IN



STABLE FITTINGS AND HARNESS BRACKETS.

PATENTEES AND ORIGINAL INVENTORS OF

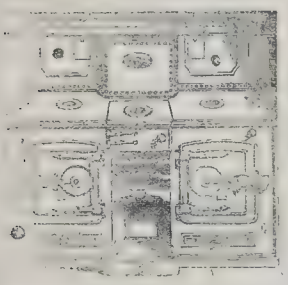
THE IMPROVED SYSTEM OF STABLE AND HARNESS FITTINGS,

PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS, AS WELL AS BY THE PRINCIPAL NOBILITY, GENTRY, AND HUNTING ESTABLISHMENTS IN THE KINGDOM.

SECURITY FROM ACCIDENT by the use of the Patent Halter Guide and Improved Curved Top-plate; PROMOTION of HEALTH, COMFORT, and CONDITION, by the cleanliness and power of resisting infection of the Mangers and Troughs, and also of the Patent Drop Cover, to curtail the quantity of water to be imbibed. ECONOMY in the USE of FOOD, from the improved formation of the Fittings, and by means of the Patent Portable Seed-box, are some of the peculiar recommendations of Cottam's Patent Compounded, Enamelled, and Galvanized Iron Fittings for Stalls and Loose Boxes.

COTTAM'S PATENT COMBINED SADDLE and HARNESS BRACKETS; IMPROVED SURFACE GUTTER, WITH MOVEABLE SAFETY COVERS; Sanitary Traps, Cheap and Durable Corn bins, and every Article requisite for the Stable and Harness-room.

IRON GATES, FENCING, and HURDLES MADE by MACHINERY.



COTTAM'S newly-invented REGISTERED NOISELESS MANGER SHACKLE and GUIDE FOR HALTER-STRAP, and IMPROVED VENTILATING HARNESS BRACKETS, are only to be obtained from the Inventors, and can be seen in use at their Manufactory.

COTTAM & CO. exhibit for inspection, at their Iron Works, 2, Winsley-street, W., an extensive range of full-sized Stalls, Loose Boxes, and Harness Rooms, the most complete that can be imagined.

ILLUSTRATED CATALOGUES and LITHOGRAPHS free, on application to COTTAM and CO. 2, WINSLEY STREET, Oxford-street, London, W.

COTTAM & CO.'S only address in London, is 2, WINSLEY STREET, W.

N.B. WINSLEY STREET IS THE STREET OPPOSITE THE PANTHEON.

FENDERS, STOVES, FIRE-IRONS, AND CHIMNEY-PIECES.

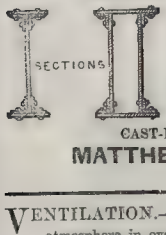
Buyers of the above are requested, before finally deciding, to visit

WILLIAM S. BURTON'S SHOW-ROOMS.

They contain such an assortment of FENDERS, STOVES, RANGES, CHIMNEY-PIECES, FIRE-IRONS, and General IRONMONGERY, as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with ormolu ornaments, 3*l.* 15*s.* to 33*l.* 10*s.*; Bronzed Fenders, with standards, 7*s.* to 5*l.* 12*s.*; steel Fenders, 3*l.* 3*s.* to 11*l.*; ditto, with rich ormolu ornaments, from 3*l.* 3*s.* to 18*l.*; Chimney-pieces, from 1*l.* 8*s.* to 160*l.*; Fire-irons, from 2*s.* 3*d.* the set to 4*l.* 4*s.* The Burton and all other Patent Stoves with radiating hearth-plates.

WILLIAM S. BURTON, GENERAL FURNISHING IRONMONGER,

BY APPOINTMENT TO H.R.H. THE PRINCE OF WALES,



Sends a Catalogue, gratis, and post-paid. It contains upwards of 800 illustrations of his illimited stock of sterling Silver and Electro-Plate, Nickel Silver, and Britannia Metal Goods, dish-covers, hot-water dishes, stoves, fenders, marble chimney-pieces, kitchen ranges, lamps, gaseliers, tea trays, urns, and kettles, clocks, table cutlery, baths, toilet ware, turnery, iron and brass bedsteads, bedding, bedroom cabinet furniture, &c. with Lists of Prices and Plans of the Twenty large Show-rooms, at

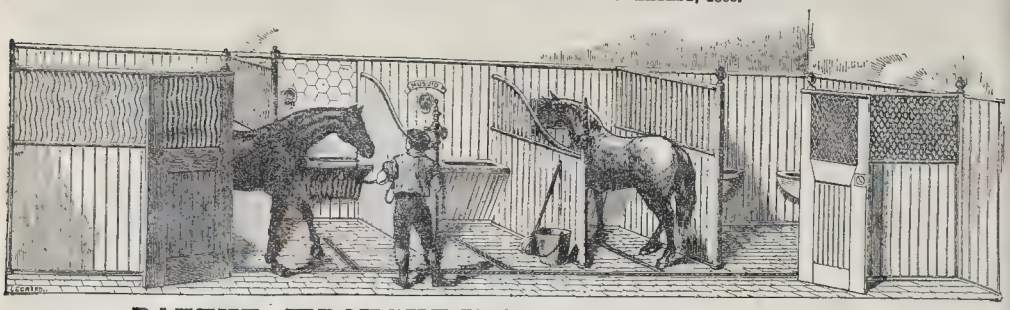
Orders requiring Despatch and Punctuality can be executed in a few days.

VENTILATION.—OVERCROWDING.—Boyle's System of Natural Ventilation ensures a *more* healthy condition of atmosphere in overcrowded than is usually present in thinly-inhabited or empty places. The heat arising from the state of overcrowding is the motive power which works this system with infallible regularity and effect. The smaller, closer, hotter, and more overcrowded a place is, the easier and better can it be ventilated on this system. It is applicable to all places alike, Cottages, Mansions, Public Halls and Buildings, Churches, Hospitals, Factories, Work-rooms, Stables, Cow-houses, Conservatories, and even Mines and Ships. Let no one form a hasty conclusion from the seeming extravagance of this statement. It is a far wiser plan to examine first and conclude afterwards.

"*In one instance under our own eye Mr. Boyle has operated very successfully.*"—Article, "Air in the Corners," *Builder*, 15th October, 1864.

THOS. BOYLE, No. 23, Little St. Andrew-street, Upper St. Martin's-lane, London. Agents, Messrs. COMYN, CHING, & CO., at same address.

ST. PANCRAS IRON WORK COMPANY,



OLD SAINT PANCRAS ROAD, LONDON, N.W.

APPROVAL OF THE ROYAL VETERINARY COLLEGE.

THE MEDALS OF ENGLAND AND FRANCE,

And the Medals and High Recommendation of the Royal Agricultural Societies of England and Ireland.

SECURED BY EIGHT SEPARATE PATENTS. LATEST, 1863.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, with RACK & WATER-TROUGH,

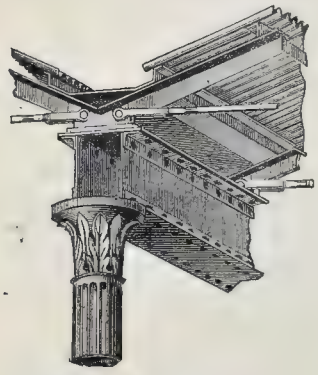
The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

THE HALTER BALL, ATTACHED BY A NEW IMPROVEMENT, WORKS NOISELESSLY, AND ALMOST WITHOUT FRICTION.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible,—advantages peculiarly their own.

THE PATENT HARNESS FITTINGS



Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

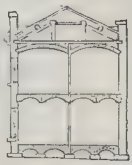
FIRE-PROOF CONSTRUCTION.—
FOX & BARRETT'S PATENT.
This improved system of fire proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.
The system combines ECONOMY with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.
The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring-boards, or of cement, asphalte, tiles, slate, or other material.
Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great desideratum of fire-proof construction, even for ordinary dwelling-houses and domestic buildings, within the reach of every one.
Further information may be obtained of the Proprietor of the Patent,
MR. BARRETT,
12, YORK BUILDINGS, ADELPHI

NO SHUTTER BARS.



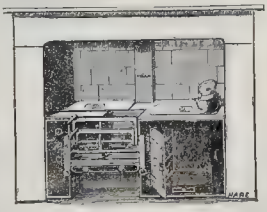
JENNINGS'S SHOP-SHUTTER SHOE.
SHOP SHUTTERS are SHOD and SECURED by the above, at HALF THE COST OF THE UNSIGHTLY AND DESTRUCTIVE SHUTTER BAR. Shops referred to in every public street in London
When ordering the above, send FINISHED THICKNESS of Shutters, and the way they go up.
Sold by all Ironmongers, and the Inventor,
GEORGE JENNINGS,
Engineering Depot, Palace Wharf, Stangate, Lambeth, S.

SMITHFIELD CLUB SHOW.—The following INVENTIONS will be EXHIBITED at the ISLINGTON AGRICULTURAL HALL, Stand 154 on MONDAY, DECEMBER 5, and four following days.
EXHIBITION PRIZE MEDAL, 1862, AND MEDAL OF ROYAL AGRICULTURAL SOCIETIES OF ENGLAND AND IRELAND.

MUSGRAVE'S PATENT STABLE AND HARNESS FITTINGS.

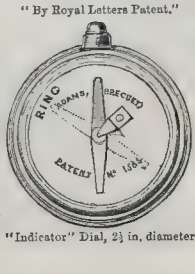
MUSGRAVE'S PATENT HARMLESS LOOSE BOXES. MUSGRAVE'S PATENT IRON COW-STALLS AND PIGGERIES.
Architects who have not seen these Fittings are requested to write for Engravings, as they are unlike those of any other maker, and were admitted to excel all the work of their class in the Exhibition. They can be seen in first-class stables in almost every county in England; and MUSGRAVE, BROTHERS, are now fitting several very large establishments under direct sanction of London Architects, prefer for adopting only what is the best of its kind. Particulars of these, as well as of MUSGRAVE'S PATENT SLOW-COMBUSTION STOVE, will be forwarded on application to
MUSGRAVE, BROTHERS, ANN STREET IRON WORKS, BELFAST.

THE DENNETT ARCH.
Allowed to be the cheapest fireproof construction known, and used with the greatest success for the last ten years in the Midland Counties, and has been adopted by G. G. Scott, esq. for the New Foreign Offices, used in any form of arch, groin or dome; turned to any length, width, or height, forming a perfect floor and ceiling in one mass, from 2½ inches in the crown to any required thickness.
Address to the Patentees, England and Canada,
A. & R. DENNETT & CO. NOTTINGHAM.
TESTIMONIAL.—"I have made use of Messrs. Dennett & Co's material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme convenience of application. I have made use of it in positions in which I should have found it difficult to introduce any other fireproof material, and it has this advantage, that the arches constructed of it are so entirely in one mass that they cover the space like a compact shell or inverted basin, and are, consequently, almost wholly free from lateral pressure
"GEO. GILBERT SCOTT, 20, Spring Gardens, London."



BROWN & GREEN'S
PATENT KITCHEN RANGES.
PRIZE MEDAL, 1862.
These Ranges combine the latest improvements with great simplicity and durability. They afford facility for roasting meat in front of the fire without interruption to the action of the oven, hot plate, boiler, &c. The Ovens are well ventilated, and perfect either as roasters, or for baking bread or pastry. For Efficiency, Economy, and Ventilation, and
CURE OF SMOKY CHIMNEYS,
these Ranges are unequalled. They are of all sizes and prices; and when fitted with Bath and Steam Apparatus, &c. they form the most complete appointment for good establishments. Designs, &c. may be had on application at THE LONDON WAREHOUSE,
72—74, BISHOPSGATE STREET WITHIN.
"One of the best arrangements of the 'Kitchener.'"—See *Builder*, Sept. 6, 1862.

DRAUGHTS & DUST ROUND DOORS & WINDOWS
EFFECTUALLY PREVENTED BY
GREENWOOD'S PATENT INDIA-RUBBER MOULDINGS
(*Can be had any Length or Pattern*).
The neatest, most simple, and effectual method of making air-tight joints to joiners' or cabinet work OLD or NEW.
Self acting Spring Slides for the bottom of doors
The most imperfect door can be made air-tight without re-hanging.
The Trade supplied on liberal terms.
JOHN GREENWOOD, PATENTEE,
10, Arthur-street West, London Bridge.



CUNDY'S
PATENT BRICK OVEN DOUBLE FALL-DOWN BAR KITCHEN RANGE.

This Range, also
CUNDY'S PATENT BRICK OVEN SEMI-CLOSE RANGE,
and
PATENT COTTAGER'S KITCHENER;
Also CUNDY'S Patent Original FIRE-BRICK Warm-Air Ventilating STOVE,
suitable for CHURCHES, HALLS, SCHOOLS, and STAIRCASES,
can be seen in operation daily at the SHOW-ROOMS of the MANUFACTURER,
Wm. ADDIS, Wholesale and Retail Ironmonger, Stove Grate and Range Manufacturer,
6, 7, & 15, LEICESTER STREET, LEICESTER SQUARE, LONDON.
A Prospectus, with full Description and Price of the above, will be sent per Post on application.

"By Royal Letters Patent."

"Indicator" Dial, 2½ in. diameter.

ELECTRIC BELLS FOR DOMESTIC USE.
BREGUET'S PATENT INDICATOR SYSTEM, with a Dial which shows when the Bell is ringing, the same as in use at the Grand Hotel, Boulevard des Capucines, Jockey Club, &c. Paris.
The superiority of Electric Bells is already settled in America and in France. For all modern works at Paris they have as effectually superseded the old crank and pull plan as, for travelling, the railway has superseded the antiquated stage-coach.
ADAMS & SON have much pleasure in stating that they have made arrangements with Messrs. Breguet, of Paris, to become their sole Agents for the sale and fixing of their Patented Apparatus upon the "indicator system," which has great advantages over all others, and is especially adapted for hotels, public buildings, and other large establishments. The details of this ingenious instrument, together with a description of the various apparatus in use for Electric Bells, may be had upon application, or by post.
WILLIAM S. ADAMS & SON,
Ironmongers by appointment to the Queen and his Royal Highness the Prince of Wales, and also to the principal London Clubs,
Engineers and Manufacturers, 57, Haymarket, and 14, Norris-street, S.W.
Works—Marlborough-row, Marshall-street, W.

TO IRONMONGERS, BUILDERS, &c.

PATENT WROUGHT-IRON WELDED TUBE for GAS; Galvanized ditto, for Water; High-pressure Cocks, &c. Manufacturers of Dr. Arnott's Improved Ventilators.
HULETT & CO. 55, High Holborn.

SMOKY CHIMNEYS,
S. DEACON

Respectfully invites the attention of Architects Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, many curing chimneys where other caps have been of no avail.

The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being allowed to pass through the Cap without the trouble of first displacing it; an increased up current, and the impossibility of a down one.

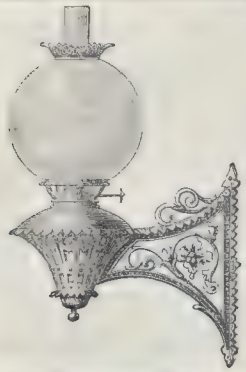
Prospectus, with testimonials, forwarded on receipt of Postage Stamp, by

S. DEACON,
59, ALMA STREET, HOXTON, N.

MANUFACTORY:
HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, LONDON, N.

THE PATENT UNIVERSAL CHIMNEY HEAD

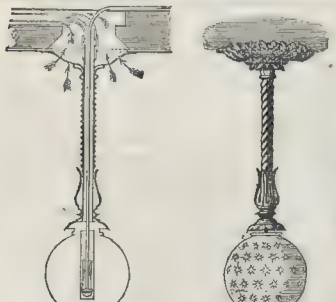
This Chimney Head has been designed for the Prevention of Smoky Chimneys and Down Draughts. The materials & apertures are so placed as to enable a wind in any direction to pass through it from any quarter, thus creating a strong current and causing a draught of air to pass through the top of the same apertures gave leads access to the wind, and so prevent any of its strength downwards into the room, and thus greatly diminish the danger of its passing down the chimney.



Price 4 Zinc ..... 24s.
Ditto, kitchen size ..... 32s.
Patent Galvanized Iron ..... 28s.
Ditto, Kitchen size ..... 36s.

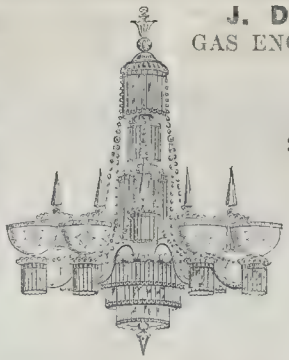
A Liberal Allowance to the Trade.

Manufactured solely by
BENHAM & FROUD,
GENERAL METAL WORKERS.
49, 51, and 52, Chandos-street, Charing-cross, London, W.C.
And to be obtained of all respectable Ironmongers in London and Country.



THE KOH-I-NOOR LAMP, to BURN HYDRO CARBON OILS,

Possessing important advantages and facilities for trimming.



BRACKET to HANGING LAMPS for CHURCHES, CHAPELS, and PUBLIC BUILDINGS, MANUFACTURED by
JOHN WARNER & SONS,
CRESCENT, CRIPPLEGATE, LONDON, E.C.
Catalogues forwarded on application

FRANCIS HAMMOND'S
VENTILATING GLOBE LIGHT,

The advantages obtained are these:—
A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION.
A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR.
AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.
A GLOBE LIGHT will consume about 7 feet of gas per hour, giving as much light as an ordinary three-light chandelier, with a consumption of 12 feet per hour.

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

DESACHY'S FIBROUS PLASTER.

GEORGE JACKSON & SONS,
HAVING BECOME THE PROPRIETORS OF THE PATENT RIGHTS IN
DESACHY'S FIBROUS PLASTER,
Beg to call the attention of Architects to its Capabilities.

It is adapted for the speedy and economical production of any coffered or circular work, waggon-headed ceilings (all bracketing being avoided, as it is fixed to the joists direct), fluted and plain columns, panelled dados, all kinds of diaper, &c., for the linings of walls and ceilings, and for all purposes of ornamental plaster.

The advantages are great. It is of great lightness and of excellent quality; it is not inflammable, and is ready to be painted immediately after it is made, it has been used (under the direction of Owen Jones, esq.) for the ceiling of St. James's Hall; at Messrs. Osler's, Oxford-street; Mr. Hancock's, New Bond-street; the Crystal Palace Bazaar; the Home for the Aged, South Lambeth; and at various other Works.

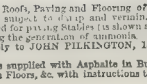
HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. Which they sell under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."



THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON

GUTTA-PERCHA MILL-BANDS.

—The Gutta-Percha Company beg to state that the increasing demand for the Gutta Percha Stripping for Driving-bands, Lathestraps, &c fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractibility and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump buckets, Fire-Buckets, Bosses, Union Joints, Flasks, Bottles, Bowls, Toilet-trays, Curtain-rings, Galvanic Batteries, Talbotype Trays, &c. &c. manufactured by the Gutta Percha Company, and sold by their Wholesale Dealers in town and country.

THE GUTTA PERCHA COMPANY, PATENTEES,
WHARF ROAD, CITY ROAD, LONDON.

POLONCEAU and SEYSSEL ASPHALTE.

ESTABLISHED  1838

For covering Flat Roofs, Paving and Flooring of every description, especially in places subject to damp and vermin. This Asphalte is now extensively used for paving Stables (as shown above), the absence of joints preventing the generation of ammonia. For Estimates and Prices, &c. &c. apply to JOHN PILKINGTON, 15, Fish street-hill, London, E.C.

Country Builders supplied with Asphalte in Bulk for covering Footings, Barn Floors, &c. with instructions to lay it down.

The Builder.

VOL. XXII.—No. 1138.

The South Kensington Museum and Schools.

WHEN in the South Kensington Museum visitors have generally found their attention taken up by the matchless works of art exhibited, — as in 1862, when the collection of objects that were on loan were displayed, some of which are still to be seen; and but little attention has been lately given to the buildings themselves, which form part of an extensive plan. Indeed, a scheme for a great institution to include the several museums and schools which are under the control of the Science and Art Department of the Committee of Council on Education, or so many of them as may not have been provided for in the Museum and School of Mines in Jermyn-street, has already advanced far to that part of its realization which is comprised in structural provision of a permanent local habitation. The public, however, have no clear idea of the extent and plan of the comprehensive group of structures, and but little knowledge of much that has been done outside of the galleries and courts that are accessible; whilst the distinction between buildings now to be considered as temporary, and galleries and courts built to be permanent, as well as the relation of these latter to the general plan, are not at all understood. In fact it is very difficult, without the aid of a plan drawn, which we do not possess, to explain all that has been done, and what is now in progress. There has been a common impression that the chief location of the South Kensington institution was intended to be on the site of the building of the Exhibition of 1862; and this was helped by the competition for the buildings for the natural history collections of the British Museum, and for the Museum of Patents, or rather by the course taken by many of the competitors in their general plans for allotment of the entire ground in that case. Long before the particulars of that competition were issued, however, a considerable portion of the group of buildings on the plan which we have alluded to as connected with the ground at Brompton, or South Kensington, now and previously in the occupation of the Department (and which is separated by Exhibition-road from that part of the ground of the Commissioners of the Exhibition of 1851, on which the building of the Exhibition of 1862 was raised) had been completed and occupied as schools and residences: before 1862, a plan for appropriation of the whole of this ground had been made; and it appeared in 1860, with a perspective view, along with the Report of the Committee of the House of Commons on the South Kensington Museum. That plan has been since altered; but it would give some general idea of what is still intended. The group of buildings, with large open quadrangles, and with iron and glass roofed courts to the museums, will occupy the entire area between the present eastern boundary and Exhibition-road. The northern limit is already defined by new buildings for the schools; but the Exhibition-road frontage is at present unoccupied; and so is the Cromwell-road end, or southern part of the ground, except eastward, where are the celebrated iron building, and the wood-and-plaster refreshment-rooms. But parallel with Exhibition-road, is the range of buildings of which the upper floors are partly appropriated as residences; and the north end of this line is connected by the new schools just named, forming a return, to the other permanent buildings, east, in which are the art-library and museum, and the Turner and Sheepshanks galleries. The ground floor of the connecting line, with the northern half of the same floor of the building in which are the residences, was lately appropriated to the exhibition of stained glass. It was reached from a large staircase at the north-western angle of the square top-lighted court. This staircase is at the northern end of the Turner and Vernon galleries; to which it may be considered the principal entrance, as also to the gallery running eastward, in which are the early British pictures that were removed from Trafalgar-square. The western front of the residences-building, as may have been understood, will not eventually appear from Exhibition-road. In the southern portion of the total length of this range of building, where the residences are, the eastern front has a very satisfactory architectural character, produced in red brick and light-coloured terra-cotta, with Portland stone for the plinth and some portions of the strings and cornice. The wall of the Sheepshanks Gallery, which is opposite, an experiment of some time since, will, we suppose, be rebuilt to correspond with the front of the residences. The parallel ranges of building we have described, running north and south, and connected at the north, will be similarly joined at two other points,—possibly in one case by an enclosed screen of arches: so that, eventually, main features of the plan will be two large open quadrangles, whereof one in the centre of the whole ground will have elevations with rich detail in terra-cotta, after the character of the short length mentioned; whilst, next the Cromwell-road, there will be two wing or pavilion buildings, and a recessed centre with quadrant-junctions to the wings. The iron structure, at present containing the Educational Museum, the Museum of Patents, the collection of building materials, casts, and furniture, besides on the upper floor, the animal products and food museum, and the naval models, the latter in the gallery formerly appropriated to the Architectural Museum, will be removed, along with the present refreshment-rooms. Also will disappear the present lecture-theatre, and offices, and the corridor leading to them, and continued westward. A new theatre will be the principal feature of a group of buildings in the centre of the whole plan, engaged with the middle one of the three cross or connecting ranges of building. The upper portion of the theatre will be seen, over and beyond the screen, from the Cromwell-road. This group and range is now in course of erection; and whilst the design repeats the character of the residences, Captain Fowke is using the terra-cotta for the cornices and strings where he had in the previous case employed Portland stone. The terra-cotta is unusually free from the defects of burning; and whilst in the first-built front, the stone is much discoloured, the other material retains its original character. Few architects have seen this front. We ought to say that it would deserve attention, not only from the use of terra-cotta, but from the general decorative result of the design. Other work in progress is that of a range of buildings skirting the eastern side of the ground where the separate entrance to the National Gallery is.

The parallel courts that were occupied by the Loan Collection, with the corridor and gallery between them, and the large square court beyond, which are flanked by double recesses or *loggie*, and corridors, are gradually receiving their decoration in colour. In the eastern court of those first mentioned, the ultimate effect may now be judged of; as almost the only thing remaining to be done is the insertion of Minton's porcelain with allegoric representations in neutral tint, or white, and blue, in the spandrels of arches, and in medallions and panels, all which are now filled by substituted paintings on canvas. The similar work of decoration of the western court has just been commenced. The flat ceiling of the corridor under the gallery, and the ceiling of the gallery, with sides sloping to a central rib, are complete.

To understand relative positions on the ground, it will be well to recollect that the corridor just now mentioned as dividing, and parallel with, the two similar courts, is in a direct line with the long corridor of the Museum of Building Materials, and opens at the farther end into the large square court. On the removal of the iron building, the parallel courts and intermediate corridor will be lengthened somewhat southward, to abut upon the block of building which we have alluded to as forming one of the two wings of the Cromwell-road front. The works at present in progress eastward of the iron building and bordering the line of the separate National Gallery entrance which is the eastern limit of the ground, may be considered as forming part of this wing.

The portion of this eastern range which flanks the parallel court and the large square court, some time finished, is now being decorated. Some of the bays or recesses which open into the eastern court are devoted to works of Asiatic art; and the decoration on the ceilings and piers, which is very elaborate, is from the designs of Mr. Owen Jones. The space already decorated will be known as the Indian Court. The whole is treated on the non-naturalistic, non-imitative, or conventional principle; but, still, in one of the ceilings especially, there is a right and perfect bringing of "realities to mind." Mr. Jones has taken great pains with this work, having made a large number of full-size drawings. He is now preparing for the work of the court adjoining, which will be devoted to Chinese and Japanese art, and will be decorated in the Chinese manner. The rooms over these courts, which are reached by a gallery extending across the north end of each parallel court, and starting from the junction of the Sheepshanks and Turner Galleries, are also complete, and in great part decorated, and have been lately devoted to the exhibition of the works of students of the local schools.

These various permanent buildings for the divisions of the museum and the schools, have been progressing more or less during the last five or six years. Taking into consideration the whole of the works, the cost incurred at the commencement and since, for temporary accommodation, would be found very considerable; and should the accounts ever be made clear, we apprehend that the comparison of them with a fair estimate of cost of the complete plan and building, supposing the works had been pursued steadily on the basis of a matured plan, will be scarcely flattering to the nation. If the House of Commons has had any share in this, the case should none the less be brought home. Few architects have any opportunity of making such a number of experiments as have been made in the production of the South Kensington buildings, or would meet with lenient treatment for the errors of design and miscalculation of cost that would be considered to be involved in changes such as have marked the progress of those buildings. There will be something to be set down, however, on the

other side of the account, should the several works be found to have solved any of the questions of museum and picture-gallery planning and construction, questions, as those of lighting, the solution of which is supposed to have been aided by the building of the Sheepshanks Gallery. The experiments made as to the proper material for flooring, and as to the fitting background for pictures and drawings, also deserve to be considered of importance. Chromatically, the effect of the brick-red tiles, with small squares of green inserted with them, is excellent; and the material, from the capability of cleansing, seems to be well adapted for the flooring of a public gallery. We observe that some of the tiles are so much worn that the flooring will shortly require reparation; but, even this could be effected probably with more facility than the reparation of a wooden floor.

As the lines of the general plan are at present, there is a want of parallelism between those of the building of the residences and of the Sheepshanks Gallery; and there would also be a want of symmetry in the parts of the connecting range which are east and west of the theatre-building. Thus, a modification in plan of the Sheepshanks Gallery building would seem to be necessary, and as the modification to get correspondence in the elevations; and it is difficult to see how the whole work will be accomplished without much trouble and cost.

When we reviewed the designs for the buildings proposed to be erected on the site of the Exhibition of 1862, we spoke at some length of different assumed principles of planning for buildings to be appropriated to the exhibition of minute objects, and the purposes of study, and raised the question whether large top-lighted areas, or small side-lighted rooms, were best. It was obvious to us when the Loan Collection was shown, that the top-lighting by day, or by night, was quite inadequate for the purpose exhibition of minute works of art, or specimens, in table-cases. There are conflicting objects; and, to attain them, it may be not sufficient to decide one principle or another: but every architect would do well to note what are the advantages and defects of the system adopted at South Kensington, which is that of large top-lighted areas with recesses and galleries by which they are surrounded. These recesses obtain their light from the areas referred to, rather than from any ordinary windows; and the result is that, where they are to such windows, or the back of the cases, by adjoining buildings, the works are inadequately seen. In the areas themselves, the light in the evening is obstructed by the head and shoulders of the persons viewing the works. We are not imputing blame, but stating facts that must be considered. Where the largest area of roof, generally in the centre of these courts is exposed for light; and great ingenuity and skill in the construction of the roofing, and taste in the ornamentation of same, and, with some exceptions, in the decoration, is shown. The gallery on the upper floor intended to be appropriated for exhibition of works from the local schools, is exceedingly well lighted from the top, or so that the whole wall-space might be utilized; though, indeed, the drawings are hung on cleverly contrived lights, so applied at right angles to the walls, as to be less distracting than that of a great gallery, and altogether most convenient for the purposes of study. The entire space, again, is divided into squares by the ribs which carry the roof and ceiling; and each square compartment has a large flat light in the centre, or below the external sky-light. The glazing of the courts is single, except that of the slopes of the roof. The pilasters or projections from the piers, at the sides of the gallery for the works from the local schools, carry angle post-mouldings and foliated caps, as well as cantilevers to the transverse beams which form the compartments of the ceiling: and the arches and piers are supported by iron ties along the walls. Space in the *plafond* between the cantilevers is arranged for ventilation, which has been generally well contrived in these new buildings. The tympana of the arches on the walls are to be divided into panels, to contain subjects painted or produced in porcelain. A specimen decoration is "erected up." The chromatic treatment is, in great part, of white and gold; but imitation marbles are largely used for the piers and walls. The gilding is not used in the best manner. Parts of leaves or of integral forms are tipped with the gold, in a manner little better than that of house-painters; a manner which we have often spoken against, and had hoped was becoming extinct. It should not be revived by the Department of Art. There are two ways of using gold, whereby it can have great value decoratively. Either it should be the background; or the whole of the leaf or other form should have the gilding. Even in mouldings, the fillet is so much part and parcel with another moulding of some kind, that the gilding of fillets should be practised cautiously. But, to put lines and streaks of gold on curved forms, is to change or destroy such forms. For instance, if it be wished to ornament the cymatium-moulding by gold, the proper course is not to run a line along the convex portion of it,—which would be equivalent to altering the form and proportion of the convexity,—but is to add an anthemion ornament, or other distinct pattern, embracing the whole, exactly on the Greek system, whether of painted or carved enrichment.

During the last few months, the eastern court above described as that one of the parallel courts which is most complete, has received some additions to its chromatic decoration, which are important elements of its effect. The whole design of these courts is of a rather higher order than that of the square court beyond them. Iron and glass roofing is used in both cases: but in the square court, the principle adopted is that of concealing the construction of the lantern by a mask of cantilevers and painted panels, though very good in themselves; whilst in the other cases, it is the structural forms that are the vehicles of decoration. It will be recollected that the roofing in each of two parallel courts, is formed with semicircular ribs of wrought and riveted iron, which are carried by iron columns of decorative character. These columns on the east side of the one court, and the west side of the other, are in advance of the walling; and the last is pierced with arches below, and panelled and arcaded with coupled recesses, and lofty niches, on the opposite side of each court, these are wall arches in perforated iron-work, pierced with small quatrefoils, and carrying the gallery which is central to or parallel with these two courts. The chromatic treatment of the whole of the ironwork is in accord in harmony with the general decorative effect, and with the face of the material. The general surface of the columns and shafts is of the iron-work itself a dark yellowish brown colour; the edges of the flanges of the ribs, and the heads of rivets are gilded; and gold is effectively introduced as back-ground to the ornament which is in a necking at the middle of each of the larger shafts or columns, and in the capitals and bases. The open-work ornamentation of the spandrels of the small arches is entirely bronzed; whilst in the arch-voits, the perforation, in the forms of leaves is divided by medallion bearing gilt pateras, or a monogram. The ornament in the spandrels to the great ribs carrying the roof, which takes the character of anthemions and other ornament, whilst flat on the face is differently treated in the two courts. In the one of which the decoration was first commenced, and which alone is sufficiently advanced for the present description, the ornament in the spandrels is blue on the face; whilst the thickness of the leaves is coloured crimson. The effect from below, however, in this case, is inferior to that in the western court, where the filling-in work to the spandrels is the same as the rest of the ironwork, only excepting that there is a thin line of gold carried round the edge of each form to define the form; and certainly the definition is much better than in the eastern court. On the web is a shaded imitation of relief-ornament, in a neutral tint; and the soffit of the rib, in the western court, exhibits a guilloche in gold, and in the eastern court, leaf-work ornamentation in colour and gold. The spiral fluting and beading of the large shafts, and the ornamentation of the small shafts, exemplify what is right principle of the treatment of metal. Where shafts are of iron, the ornamentation should be distinct from that appropriate to, and habitually associated with, stone; and should combine the production of something specially appropriate to metal. It should, in short, utilize the distinctive properties of the material; and this, the shafts in these courts accomplish, and with good result in each respect: for, mark! there is no question suggesting itself here, as to the security of the spirally-formed supports; the mind has only to concern itself with the beauty of the twisting, feeling assured of the strength in the material.

The decoration of the side-walls above the arches is defective as to the forms of the spandrels or other spaces over the coupled recesses; whilst the centre-medallion there does not fill in harmoniously. But the impression is lessened by the effect of the works painted in these coupled recesses, of which we shall speak shortly. We should add, however, that the painted imitation of festoons, which terminates the wall at the top, and the substitutes similarly for actual relief, or carving, that are inserted in medallion spaces and spandrels of arches, on canvas, in blue and neutral tints, are quite at variance with the principles with which the Department of Art set out, as with our own, promulgated before the Department came into existence. In one conspicuous portion of the work, there is an imitation of panels with water-leaf ornamentation of the mouldings, and cast shadows, or all painted. We expect this sort of thing from the paper-hanger-decorators, but not from the Department of Art, with its antecedents. It is not sufficient to say that the practice we refer to, of substituting shams for true work, was in vogue in the Cinque-Cento decoration of the Italians. During that time, men who were painters much more than they were architects, chiefly were engaged upon the designing and decoration of buildings: the architectonic principles that should have guided the work of the very decoration by the painter's art, as well as the distinction that there is between what is a picture and what is mural decoration, were not appreciated then. The method adopted is quite opposed to the excellent one, as it is in the main, of the treatment of the iron construction and ornamentation. When the artist begins by saying, "I have not the real vehicle of effect [in this case carving, or at least cast-work], accept the inferior and the sham," he begins by a failure,—such as is opposed to all idea of real art; and he simply disgusts by his pretence at a flight that he had not been asked to make, and for which he was not furnished with means and resources. Neither the painter's art, nor the decorator-architect's, has anything to do with the production of things "to be mistaken for realities." It is discouraging to find that these should be so much difficulty where least we could in pursuance of principles which are of much importance to the future of architecture; and in which perhaps there is the only hope of distinctive Christian. Possibly some of the designs described as to be produced in Minton's porcelain, are to be in high relief, as they were,—that is, in relief; but even this would not justify the present injury done to public taste, and cannot apply to the imitations of mouldings.

The present seven bays of the length of each court, give fourteen of these shell-headed recesses in the wall above the arches of the floor-level. In the eastern court, these fourteen recesses are filled each with the portrait of a celebrated artist. In the western court, though the general decoration is only just commenced, two of the panels have been similarly occupied. The whole of the subjects are painted on canvas which is fixed up; and the figures, and any accessories, as buildings in the case of the architects, are executed with gold back-ground, which is either crossed with brown lines to represent mosaic, or diapered. The usual colours are employed, but with a spirit instead of an oil medium. Thus there is none of the reflection which results from the use of oil or varnish, and which is generally unfavourable to architectural effect, and especially to painted decoration. The use of turpentine, however, is not consistent with durability; the reasons of which were adduced, some years since, in our pages, in a series of articles wherein we reviewed the recent researches of M. Chevreul. But the South Kensington works, as we have explained, are not contemplated to be permanent. For permanent work, on plaster, the "marble-medium" used by the late Mr. Stylebrand Le Strange, and encaustic, should be taken into consideration. The application of the gold back-ground is at once seen to result in a particular harmony with architecture. This was the sort of decoration which Sir Charles Barry once told us he would have had generally adopted in the Westminster Palace. The fourteen subjects in the eastern court, with the names of the artists who painted them, are commencing from the north, Torrel, by Mr. Burchett; Wykeham, by the same; Cimabue, by Mr. F. Leighton,—a work reminding us of the white-robed Cimabue in his processional picture which first made him generally known; Nicola Pisano, also by Mr. Leighton,—in a dark tone of colour, somewhat too strongly contrasting with the Cimabue, though, like it, a fine work; Michelangelo, and

Raffaelle, by Mr. Godfrey Sykes; Wren, and Hogarth, by Mr. Eyre Crowe; Mantegna, and Ghiberti, by Mr. Wehnert; Palissy, by Mr. R. Townroe; Durer, by Mr. Cave Thomas; Luca Della Robbia, by Mr. Moody; and Phidias, by Mr. E. Poynter. The two portraits in the western court, are of Inigo Jones, by Mr. Morgan; and Jean Goujon, by Mr. H. A. Bowler. Jones is represented with the Banqueting House, Whitehall, in the background, and with a plan in his hand: with the portrait of Jean Goujon, is the Louvre; with the Phidias, the Parthenon; and so on. The north end of each court is spanned by a bold arch, springing from the level of the floor of the transverse gallery, and with the soffit filled in with square and oblong panels or coffers. The squares are to receive painted or other subjects in colour; the oblongs are to have subjects in the neutral and blue, similarly to the arch-spandrels and the medallions in the body of the court. The gallery of the eastern court leads directly into an anteroom to the gallery for the drawings of the local schools. This room has a coved and flat ceiling with top light, and is altogether well designed.

The flat ceiling to the central corridor, under the gallery between the eastern and western courts, is divided into seven squares, corresponding with the number of bays, and each framed in by a gilt moulding, and a broad band of blue with a guilloche. In the centre of each compartment is a medallion-form, painted with a shield of the royal arms, or with the lion of England, or that of Scotland, or the harp of Ireland. The medallion is surrounded by a representation of bronze scroll-work; and the rest of the space is filled by marginal lines of colouring, and by diapering. The sloping ceiling to the gallery above, is divided into square coffers, which are effectively painted with a broad margin of red, and some ornament of a simple character. At the end of this gallery is a look-out into the square court, from the well-known marble *cantoria* or singing-gallery, which forms one of the acquisitions of the Museum. The segmental arch-headed opening beneath, forming the entrance to the square court from the corridor, has the worst form of stilted segmental arch that we ever saw. The thing is not creditable to South Kensington. The misproportion which there is between the segment of the intrados, the 2 in. or 3 in. of stilting, and the very wide archivolt is preposterous.

We cannot now say more of the collections, than that the Museum of Building Materials is only one of those which should be studied. With the building-materials are many models of roof-timbers, roof-covering, and flooring, and others of contrivances of the greatest importance to architects. And amongst the models are several of historic value, that were formerly in Westminster Abbey; and, besides, there is the model of Wren's original design for St. Paul's. Another model of St. Paul's, which has been presented to the Museum, should be cast away at once. It is incorrect from the form of the dome to nearly every detail. The fine collection of architectural casts, part belonging to the Architectural Museum, and displaced to make room for the naval collection, and part the property of the Government, are all below stairs, in the iron building and the corridor leading out of it to the temporary offices. Most of these works have suffered by the repeated removals. When we consider the utility of such casts, the difficulty in getting them, and how liable they are to be broken or abraded, we should expect them to be preserved with somewhat the same care as old china.

PICTURES ON MUSIC.

In the interest of a bright-eyed circle, we are about to call attention to a particular branch of art which, although it has made progress within remembrance, is yet open to great improvement, the pictorial embellishment of the title-pages of music. The class for whom this ramification of art spreads its attractions is comprised of young people, and principally of young ladies, whose criticism is not of the rigorous nature calculated to stimulate the exercise of any great effort of creative power: it must therefore be from some outside influence that we must look for advancement. It may be questionable whether illustrated title-pages are called for; but, if pictures be used, there is no question but that they should be of a certain degree of excellence. There are, we admit, varieties in the quality of the highly-coloured title-pages displayed to view in the shop windows; but the general impression gained by a cursory glance at them as a whole is that they are scarcely above valentine art, and considerably below that of the French plum-box. Frequently a large bouquet of unbotanical flowers occupies the sheet; in other cases a figure, representing some personage in the opera or ballet with which the music it accompanies is associated, is displayed upon a background on which is depicted in an unfathomable distance a few accessories; or, again, a highly-restive horse with remarkably red nostrils and prominent hoofs is depicted upon the page, either reclined against by a Zouave-like proprietor, or mounted by the military possessor of a very gaudy uniform. We might do something better than this: we ought to do it.

One way of acquiring and of giving impetus to progress, is to review that already made. The fact of growth is then impressed upon the mind, and we argue to ourselves that the next twenty years will be fraught with as much change as the last term of the same period. Looking back, then, for this purpose, over piles of old music, much of which is inscribed to their Royal Highnesses the last Prince and Princess of Wales, the Duchess of York, Duke of Cumberland, and other members of the large family of George III., we are brought speedily to the admission we made at the opening of these remarks. The smart though meaningless title-pages with which our music publishers make their wares showy are improvements upon the devices used for the same purpose in the last age. Portraits of the composer, with a sheet of music in one hand and a pen in the other, were then a favourite embellishment. Ladies in outline, seated at pianos, also in outline, were often likewise placed upon title-pages. But the most curious illustrations are those that accompany descriptive pieces. A piece of music, printed with faded ink on ribbed blue-tinted paper, called "The Fair," is a representative piece. This is headed by an engraving showing a fair, arranged in a symmetrical manner, with much of the appearance of a trim Dutch garden, the people clustered in circles and squares, looking on at the various performances, having a strong resemblance to clipped trees. We quote the title-page with relish, as a photographic indicator of bygone sports and scenes this generation is just able to recall:—"Grand Miscellaneous, Curious, and Comical Piece of Music called 'The Fair,' consisting of a great variety of little Bagatelles, selected and revised (merely) for the amusement of Young Folk, in which is introduced the 'Fall-down of Paris;' the whole concluding with a new and joyful piece of Music, composed for the occasion, called 'The Signing of the Definitive Treaty and the Restoration of France, or Peace proclaimed between Two Great Nations,' announced by the sound of trumpets, bells ringing, playing many peals, and the firing of the guns, most respectfully inscribed to the British Ladies, by Signor Sampieri. Description of this entertaining piece, in which is exhibited a variety of very pleasing scenery, as follows:—Dancing bear, dancing dogs, men fighting, dogs fighting, Punch beating his wife, gallantee show, ballad-singer, woman shaving a man, another, cooking, boy on a swing, carravan with wild beasts, and a great quantity of shops and other things." It will be observed that the author has failed to make it clear whether the "very pleasing scenery" is in the engraving or the music. However, the "joyful piece" opens with the tune of the dancing-bear. Above the line giving an accompaniment for the violin are depicted three tiny figures—a bear with a cap on his head and a stick in one of his paws, a man in knee-breeches leading it by a string from its muzzle, and another tapping a musical instrument carried under his arm. A slight change in the tum-tum-tum-like tune is headed, "The Gallanty Show:" this is illustrated in the same interlineal manner. A little man, rather more than half an inch high, is standing guard over a peep-show as tall as himself, into which three boys are peering, whilst another boy and a girl are waiting their turn to do the same. The dancing-dogs figure at the commencement of the next variation of the tune. There are four of them, standing on their hind legs, under the superintendence of a man and a woman, the latter flourishing a whip. The fall of Paris proceeds without pictorial aid, till peace is proclaimed, when two trumpeters, a bellman, and two gentlemen, with swords and cocked hats, appear walking on the fifth line of the bass clef, as though it were a tight-rope. Three artillerymen fire off three cannons simultaneously from the fifth line of the violin accompaniment. After a passage, in which the ringing of bells is imitated, a little tower appears on the top of the bass clef. The last illustration fills a whole line. It represents "Quick march and retreat of the whole army going to be disbanded." In this there are thirty-three soldiers, all under an inch high, divided into infantry, cavalry, and artillery groups, marching across the page, preceded by a drummer, and brought up by an ambulance or ammunition van. Numbers of the popular pieces of the same period were pictorialised in the same discarded manner. Another mode of embellishment consisted of an engraving placed to head every variation in a piece, called descriptive engravings. "A grand series of musical compositions" before us, "expressing various motions of the sea," is divided into four parts. It opens with "a promenade to the shore, supposing a party going to embark," a light march bearing that title. A view of a bit of shore, with several ladies in scanty skirts, and gentlemen in knee breeches, standing about, with fifteen sails in sight, besides five heavily-loaded boats, illustrates the next movement, "a perfect calm." A second engraving shows a pier, with a light-house at the end of it, from which is unfurled an enormous flag, some shipping very much out of the perpendicular, and a hatless figure, to convey an idea of the sea with "a fresh breeze." And a third illustration renders "a storm" by the aid of some very woolly waves engulphing six vessels of different degrees of proximity, whilst a group of five men, on a bit of landscape in one corner, are attending to another, apparently drowned, just washed ashore. No startling figures appear upon the clefs in this piece; but it is copiously explained as it proceeds. Thus a sort of shake is the "sea immensely high;" the same tremulous motion among the lower notes denotes that the "vessel is nearly lost;" a rattling of octaves suggests that "the waves are extremely agitated," and a chromatic scale makes us acquainted with "the distress of the passengers." We can make as much progress from where we are now as we have done from what we did then. Another illustrated "piece" of this same late Georgian era depicts "The Progress of Nature in various Departments, as follows: the Sportsman, Garden-man, Fisherman, and the Woodman." This is illustrated by four coarse etchings: the first consisting of a country alehouse, with four couples of sportsmen in top-boots and low-crowned hats, out in different directions in the adjoining landscape, and the inn-keeper watching their proceedings over his half-door, with a calculation, doubtless, as to their ultimate thirstiness; the second a very stiff garden, in bad perspective, belonging to a very formal house in still worse perspective, in which three gardeners are at work, all in top-boots, it may be remarked, but without any coverings for their heads, the foremost of whom is supposed to be singing a little ballad as he is digging a leviathan cabbage-bed; the third, a village on a bank of a river, the principal item in which is a large fish-stall, around which every inhabitant of the district appears to have congregated; and the fourth, a ravine into which a wooden bridge is being precipitated just as four passengers are in the act of crossing, whilst a group of people are occupied in the foreground with felling a tree, chopping wood and carrying it away, cheered by the strains of a flageolet played by a man in the characteristic top-boots, knee-breeches, and low-crowned beaver. These etchings, quite caricatures in their coarseness, as well as the gaudy chromo-lithographs of the present day, make but a sorry show against the manuscript music of old, such as that preserved in the library of Durham Cathedral, written on vellum, when the Mediæval men lavished the labour of days upon an initial.

It is curious that music has been thus overlooked in our time as a suitable subject for pictorial embellishment. Poetry and prose have been profusely illustrated and perennially bound for Christmas gift-books and New Year's presents; but it does not appear, yet, to have occurred to artists to illustrate in a first-class manner the grand works of Handel, Haydn, Mozart, Beethoven, Spohr, Mendelssohn, and other great composers. Where could they look for a grander theme than the "Creation" would afford, or for more ample scope than in Beethoven's "Pastoral Symphony?" It would be difficult to suggest a more sublime subject for the most exalted pencil than Handel's "Messiah," with its prophet, angel, and shepherd-singers and eastern scenery.

We are happy to throw out a suggestion which, if acted upon, will open out a new field both for producers and purchasers; and hope to recognise among the gorgeous volumes now annually prepared for gift-books, the majestic compositions of our great musicians worthily embellished by art.

CROWE AND CAVALCASELLE'S "NEW HISTORY OF PAINTING IN ITALY, FROM THE SECOND TO THE SIXTEENTH CENTURY."*

In the two handsome and beautifully illustrated volumes before us we have an ambitious and in some respects careful and able attempt to illustrate the early history of the great schools of painting in Italy. "We have presumed" (our twin writers assert in their brief preface) "to place before the reader an instalment of two volumes, comprising the history of painting [*in Italy*] complete to the close of the fourteenth century, partially so to the end of the fifteenth, leaving the sixteenth untouched." Two more volumes, or "two subsequent volumes," as their authors are pleased to "describe their future labours, will [if we understand their meaning correctly] complete their work;" but in what way this can be accomplished with justice to their subject we are at a loss to understand. Leonardo and Michelangelo and Raffaelle are as yet untouched;—but this is forestalling criticism. In the meanwhile let us be content to say that we welcome and approve the two-volume instalment of a new History to which Mr. Murray has given his Albemarle-street *imprimatur*, strangely enough without a printer's name to either volume. The printers, let us add, could have no reason, that we can see, to be ashamed of their types in general; for the typography, to our Caxton and Cox & Wyman eyes, is in every respect excellent.

This valuable "instalment" of a much-needed work is illustrated with sixty-six plates or engravings, drawn on wood by Mr. Scharf and others, and cut by masters in the art of working on box. These sixty-six illustrations will delight amateurs and artists, ladies and little readers, alike; while the letter-press, if it fail to warm or enliven the reader, will be found continually to instruct; and here let us mention thus early that Messrs. Crowe & Cavalcaselle have not been contented with *printed* materials alone, but have dived into archives and perused manuscript records too little known, illustrative of the labour they undertook with a loving and faithful sense of the greatness and interest which surround a noble and a self-set task.

It has been said, and with truth, that the race of Virgin Mary painters went out with the Reformation, and that the loose hair and lifted eyes of the Magdalen ceased to be scriptural and animated on canvas at the close of the sixteenth century. These volumes, even in their minute outlines, exhibit with exquisite beauty how much action alone will contribute to expression, and occasion a sigh for English art in its loftiest sense when we reflect that the English school has little more to show of high *figure* art than Sir Joshua's tameless "Holy Family" and Sir Thomas's gladiatorial "Satan summoning his Legions," while they at times pleasantly remind us of our "gentle visionary Blake," of John Flaxman, and Thomas Stothard.

Good English writers on Italian art (or art in general), are few in number. Sir Joshua's "Discourses," and Flaxman's "Lectures," are worth the greater part of the professional lumber which the Royal Academy has inflicted on the ears of its students, or endeavoured to engage the eyes of the public with by the types of the printer. On the other hand, men and women, not artists, have written admirably on art. Let us name a few. The elder Richardson, Horace Walpole, William Hazlitt, Allan Cunningham, Mrs. Jameson, George Darley, and Mr. Ruskin.

Hoffner's printed description of Stothard's "Canterbury Pilgrimage," is the best pen description of a picture by an English painter that we can call to mind.

When studying the notices of the several masters included in Messrs. Crowe & Cavalcaselle's two volumes, the student of art will be surprised to find how indifferently rich England still is in examples of the early Italian school. Our National Gallery,—thanks chiefly to Sir Charles Lock Eastlake (to whom these volumes are appropriately inscribed),—has become of late a little academy of early examples of Italian art preceding Michelangelo and Raffaelle. Strange to relate, our all-diligent authors have been unable to find a single stray specimen of the art age they illustrate in the far-famed Bridgwater or Grosvenor galleries; yet, curiously enough, they have found in the Dublin National Gallery, in the Liverpool Gallery, at Locke Park in Derbyshire, and other outlying London quarters, "art treasures" of moment in illustration of the period over which their "New History" extends. The late *still* lamented Prince Consort did much towards a revived appreciation of early Italian art, in which he followed the good examples of Lord Dudley and Ward, Lord Northwick, Lord Wensleydale, Sir John Boileau, Sir Charles Eastlake, Mr. Fuller Russell, Mr. Fuller Maitland, Mr. Dilke, Mr. Layard, Mr. Barker, and Mr. William Coningham.

Authors affect at times to judge of the style of books by their opening paragraphs. Who has forgotten Lord Macaulay's rather servile imitation of Swift in the first paragraph of his "History?" Here is Messrs. Crowe & Cavalcaselle's prologue or symphony of fifteen lines:—

"In the most prosperous times of Rome, the arts never attained to the perfection of the models created by the genius of Greece. Long before the golden age of the Antonines, sculpture and painting had degenerated from the high standard upheld in the great times of the Empire. From that period till the rise of Christianity, they pursued an uniform path of degeneracy, yet they retained such vitality as to impose their laws on the nascent Christian school. It is not the object of these pages to trace the decline of classic art or to record its fall. A study of Christian art from its beginning in the catacombs of Rome and Naples, to its decline and fall in the first ten centuries, and the final development of its genius, as it rose to the perfection of Giotto, Ghirlandaio, and Raphael,—such is the purpose to which these pages are devoted."

After much choosing and constant rejecting, we select as a sample of our authors' skill in conveying their art-knowledge to their readers a passage from a chapter of thirty-five pages devoted to Fra Filippo Lippi:—

"The historians of Italian art may indulge in a justifiable exultation at having rescued one of their great painters from the stigma cast upon him by Vasari. It were to be desired that the character of Fra Filippo should be freed from the stain which rests upon it, as that of Andrea del Castagno has been cleared from the imputation of murder, which made his name for centuries a byword amongst artists. It is unfortunately not possible to give distinct proofs that Fra Filippo was not a monk of loose habits. Yet there is much in the history of his life, such as it lies before the student of this century, to cast doubts on the veracity of his accusers, and to mitigate the censure of the critic.

"Filippo was the son of a butcher named Tommaso Lippi by Madonna Antonia.* Her death, shortly after 1412,—the date of this event,—has deceased two years later, left Filippo an orphan in the hands of an aunt, whose poverty disabled her for the duties of a mother. In 1420, Filippo was registered in the community of the Carmine at Florence.† From that time till 1432, he remained an inmate of the monastery,‡ and probably studied painting in the neighbouring chapel of the Brancacci.§ In 1430 he appears for the first time in the books of the Carmine with the title of painter. In 1432, he left the monastery and ceased to be noticed in its records. Hence the natural conclusion, that the works which Fra Filippo may have executed there, were completed between 1430—1432. We lament the disappearance of these early productions; in one of which, says Vasari, 'the spirit of Masaccio seemed to have entered the body of Fra Filippo.'‖ Such parts of the frescoes of the Carmine cloister as have been rescued from whitewash can scarcely be said to display the characteristics of the friar.**

"Hindeed we attempt, in a rapid sketch, to resume the principal features of his style, we shall find that Fra Filippo's chief excellence was that which distinguished him as the greatest colourist, and the most complete master of the technical difficulties in art, of his time. He may not have stoically held to the severely grand maxims which signalise the genius of Masaccio; but he gave luxurious attraction to his works by a charm of colour, in which indeed he may claim to have been unique.†† A full brush, handled with breadth, produced a deep impasto. A careful return to the parts fused them into a soft fulness, and left a bright clear tone behind. Yet Filippo was not free from the peculiarities of his age. In his effort to reproduce the reality, he did not aim at the roundness of nature, but preferred the characteristic flatness usual in bas-relief. The want of massiveness so produced was, however, compensated by taste and feeling. His compositions were not without grandeur; and if he remained second to Masaccio in the perfect distribution and arrangement of a picture, he supplied his deficiencies by movement and exuberance, chiefly in the numerous pleasant episodes which give interest and animation to the scenes he depicted. His figures individually might be less dignified and grand than Masaccio's, but he threw an amount of life and gentle feeling into the heads and features, that, combined with beauty of colour, create a most pleasing impression. His style as a draughtsman was good. Master of nude form, though frequently generalising the drawing of extremities, his pictures display less progress in the study of detail than those of Uccelli, Andrea del Castagno, Domenico Veniziano, or the Peselli; but, if inferior to them in this respect, he avoided the vulgarity of their realism. His draperies, particularly such as clothed female forms, were luxuriously adorned with ornaments in gilt relief, according to the fashion of the time, and to the example of Masolino.* He did not multiply realistic minuteness in landscape like his naturalist contemporaries, but he preserved simplicity and due subordination. Fra Filippo's style, in fact, was a medium between that of the naturalists and that of Angelico, Masolino, and Masaccio. Perspective owed little of its progress to him. He never ventured to foreshorten figures, and his architecture discloses little knowledge of the art which Uccelli brought to such comparative perfection. He supplied this want, however, to some extent, by atmosphere. At first he followed the architectural style of Angelico and Masolino. In the frescoes of his later time one may observe somewhat heavier proportions. His partiality for luxurious ornamentation in pilasters, friezes, and cornices, was, throughout his career, remarkable."

We have included in our extract the foot-note references, rendering thereby only due justice to researches of Messrs. Crowe and Cavalcaselle. In the meantime we shall wait, in common with others, for the steady completion of a labour of well-selected love for which they are in many respects so well fitted.

Let us add that there is an ample supply of "Index" learning for the palest student of art-knowledge, and one omission of acknowledgment in the volumes before us. The names of the several excellent wood-engravers deserved to have found a corner on the blocks they cut, and on a fly-leaf of their own. With the aid of a magnifier we have been able to discover occasionally the names of J. Cooper, J. Thompson, and S. Williams.

THE PETROGLYPHS IN ARGYLLSHIRE.

There have recently appeared in your journal two highly interesting communications on the subject of the petroglyphs, or concentric circles, incised on rocks, which have excited so much attention among archæologists of late.

They were first observed in Northumberland a few years ago, and were then thought to be confined almost exclusively to the North of England. They have since, however, been found in various localities and countries; among others (as is mentioned in the *Builder*, p. 642), in Argyllshire. I have lately had an opportunity of examining these latter, in company with much better archæologists than myself. You may therefore, perhaps, think that even such a brief and imperfect description of them as I am able to supply may have an interest for some of your readers; for I believe it is only by bringing and comparing together as many examples as possible of these mysterious records of an ancient people that a reasonable hope may be indulged of forming some probable opinion of their true character, purpose, and signification.

There are two localities in which they have as yet been discovered in Argyllshire. These are situate about six miles from each other, in a district which is eminently rich in so-called Celtic remains, such as standing stones, single and combined (including a perforated, or "Odin's stone†"); megalithic circles, more or less perfect; many large cairns; a vitrified fort; Danish or British forts, &c. Both these Argyllshire groups of petroglyphs are sculptured on the smooth crowns and gently-sloping sides of rock-knolls, or bosses of very hard, coarse, sub-crystalline‡ greenstone, which slightly protrude from the braeside about halfway up between the subjacent strath and the ridge of the environing hills. The first and smallest group is situate about half-a-mile above Callton Môr, the residence of Mr. Malcolm, the principal landowner of the neighbourhood. It consists of seven or eight well-defined concentric circles, besides a few others less distinct. They are mostly of the normal type figured in the *Builder* as No. 1, with a cup-like hollow in the middle, surrounded most commonly by three or four concentric circles, through which a radial groove, or channel,

* By J. A. Crowe and G. B. Cavalcaselle. Vols. I. and II. London: John Murray.

* This fact is ascertained from records kindly furnished by Dottore Gaetano Milanesi. According to Vasari, Filippo was born in the Contrada dell' Ardiglione by the Canto alla Cuculia in Florence and behind the convent of the Carmine. (Vol. IV. p. 114.)

† Records, furnished by Dottore G. Milanesi. ub. sup.

‡ Ibid.

§ The doubts hitherto raised on this point are settled now that we know that the frescoes of Masaccio at the Brancacci were completed before, 1428.

‖ Records of Dottore Gaetano Milanesi, ub. sup.

¶ Vas. Vol. IV. p. 116. Fra Filippo's works at the Carmine were, a Pope conferring the rules to the Carmelites (terra verde) in the cloister, a S. John the Baptist in the church, a S. Martial on a pilaster near the organ.

** See antea in Masaccio.

†† This is more particularly true as regards wall painting. And so, the Florentine school gives us, as before, a full sequence of progress in every branch of art.

* A peculiarity in Benozzo Gozzoli also, which Masaccio avoided or disdained.

† Marriages were often contracted at such stones by the male standing at one side and the female at the other, and joining hands through the central hole. Allusion to this was lately made at a meeting of the Archæological Institute.—Ed. B.

‡ I had believed this to be the usual chloritic schist of the district, altered by trap, with which it is in contact; but Professor Tennant assures me it is greenstone.

passes from the central cavity to beyond the outermost circle, in a straight or sometimes slightly curved line, and with a downward (and, here at least, easterly) direction. I should mention, however, that two are not strictly circular, but of a decidedly horse-shoe shape. They are all placed very close together, and are frequently connected with each other, either by the said radial groove, or by a prolongation of the exterior circle. So that, as they occupy the summit of the little rock-knoll, and its sloping face, any sacrificial blood (as has been suggested) or other liquid, poured on the top would flow through them to the bottom. The circles, at this locality, vary from about 5 in. or 6 in., to perhaps nearly 12 in. in diameter. The average dimension of the grooves may be set down at ¼ in. to ¾ in. in depth, and rather more in width; while the central cups are from 1 in. to 2 in. deep, and 2 in. or more in diameter. These grooves have evidently not been worn, or hollowed out, by friction; for they are not smooth, and there are evident marks of their having been chipped, from the outer edge, by a narrow, and seemingly blunt, instrument, probably of flint, of which numerous specimens have been found in the surrounding cairns, derived most likely from the altered chalk beds of the adjacent country of Antrim. Besides these complete circles, there are several of the characteristic cup-like holes, which may in some instances have been intended for the centres of circles that never were finished; but, in others, are placed too close together to admit of such a supposition. I should, however, add, that the surface of the rock is here, as elsewhere, covered with a thin layer of peaty soil and herbage, which has been only very imperfectly cleared away; so that it is by no means ascertained how far these curious incisions may extend; while doubtless many similar rock-sculptures exist in the neighbourhood, yet undiscovered, but which accident may any day bring to light. On the same side, but lower down, and nearer to the mansion of Callton Môr, two similar circles are to be seen, on the top of a small smooth rock, nearly obliterated by exposure. And it is said there were originally many more such sculptures on an adjoining rock, which was destroyed in making a road, some few years since.

I must also observe that at least five such circles, with a central cup, and descending groove, have been found by the Rev. R. J. Mapleton on some tall "standing stones," in the immediately subjacent valley; together with many of the above-mentioned cup-like hollows, evidently artificial, but unsurrounded by circles. This is sufficient at least to connect the rock-sculptures with these (commonly believed Druidical) monoliths. While elsewhere, as I shall have occasion to remark, though not (I believe) as yet in this district, similarly incised circles have been found on the *inside* of the covering slab of as many as ten or twelve cists.

But much the most considerable and instructive collection of these incised rock circles occurs near a small farm, called "Ach-na-breac," about two miles from Lochgilphead, and a quarter of a mile above the *old* road from that place to Kilmartin. This, like the former group, is situate on a tolerably smooth but much larger rock-knoll, projecting from the mossy hill-side, and with two faces sloping, the one towards the east and the other towards the south, but slightly separated by rather broken rock, thinly covered with peatmould, &c. "Breac," I believe, in Gaelic, signifies a spot or freckle, and is the common term used for the marks of the small-pox; but, as it is equally applicable to a "field spotted with stones," I cannot pretend to say whether or not there be here any allusion to the circular marks on the rock above. That rock, however, itself bears the very significant name of "Leach-na-Sluagh." "Leach," of course, means a "flat stone, or rock;" and the Gaelic dictionaries give "host, or army," as the equivalent for "Sluagh;" but the best Gaelic scholars we could interrogate on the spot assured us they commonly used the word for any gathering, or assemblage of people together, for any purpose, civil, religious, or military. On the crown and adjoining eastern face, I counted upwards of forty well-defined circles; on the other and lower side, more than thirty; besides several others, more or less imperfect. But, though some of them have been long uncovered, so as to be overgrown with grey lichen, a large portion has only been lately brought to light, while the soil has been as yet very partially removed, so that it is impossible to say what number of these strange symbols may exist here. Speaking generally, they may be said to preserve the same normal type already described, of a deepish central cup, surrounded by from one to seven or eight concentric circles, traversed by a commonly straight but sometimes wavy radial groove or channel, which often extends to the next subjacent circle. But, as might be expected in so much larger a number, there is here a greater diversity of form and dimension. A few on the crown of the rock are rather more than 3 ft. in diameter, and have seven or eight concentric circles; but their grooves are much shallower and narrower than those of the smaller circles. I do not remember to have observed here any examples of the horse-shoe shape; but two or more figures are sometimes combined in a way not easy to describe without a diagram, by a prolongation of the external concentric groove, or by being included within one and the same circumscribing curve, so as to assume the form that has been termed "kidney-shaped." There are also here very many of those characteristic cup-like cavities, sometimes single and isolated, sometimes arranged apparently in a sort of pattern. In particular, towards the bottom of the southern face, I observed four such circular cavities, 2 or 3 in. deep, arranged in a straight line; and immediately above the end one, another similar cup, connected with the radiating channel, or spout, of the lowest superior circle. So that, certainly, whatever might be the *intention* of such arrangement, the *effect* at least would be that any liquid poured on the upper part of the face of this rock would be conducted through the higher circles into this cup; and, when it was full, would overflow into the others beneath. On the other hand, I must allow that elsewhere, on the eastern side, some, but not many, of the "spouts" are so arranged *athwart* the rock, that the supposed liquid would not readily so pass.

In addition to these concentric circles and artificial holes, I observed in one place the evident representation of a two-sailed boat, cleanly and sharply, though not deeply incised in the rock, and quite overgrown with grey lichen, so as to be, to all appearance, contemporaneous with the circles. It is about 4 in. or 5 in. long, and 5 in. or 6 in. high. Also, on the crown of the rock, are two legs of an acute-angled triangle, deeply cut, and about 3 ft. or 4 ft. long, the termination of them not being very distinct. The apex points to the east; but I much regret that not having a compass with me, I was unable to take the exact bearings of the "legs," or of the several radial "spouts;" for which I am the more grieved, because I cannot help believing their direction has a certain astronomical signification. The two sides of the imperfect triangle especially point to two quarters in the heavens, which, from their position, I think may very probably prove to be the places of sunrise on the longest and shortest days. I have, however, reason to believe that a clerical friend in the neighbourhood, who has taken deep interest in these investigations, will shortly supply this omission, and clear up this point, by accurate measurements of them all. Near this imperfect triangle, but not quite parallel to either of the sides, are two straight lines of small, but very clear, double indentations, more like the footprints of birds in snow than anything else I can think of. These must likewise have their significance, whatever it may be. Not far off, I saw a very much smaller, but comparatively deeper, figure of a triangle, much resembling the Queen's "broad arrow." And lastly, on a spot from which I myself stripped the covering peat, I found, close to a somewhat imperfect circle of the usual character, some rectangular markings, at which I can make no guess.

Such are the chief remarks I made during one long and careful visit I paid to these very curious records of undoubtedly a very ancient race of men, by whatever name we are to call them.

But I need scarcely say that these rude symbols excite a very different feeling, and tell a very much more impressive tale, when seen and mused over *in situ*, on their own wild and lonely hill side, than what can be conveyed by even the most accurate and eloquent description. And what is that tale? Truly, not a very plain one, it must be confessed; nor one that is interpreted alike by even competent observers. I see by the *Gentleman's Magazine* for October, p. 475, that Dr. Collingwood Bruce, to whom has happily been intrusted, by the liberality of the Duke of Northumberland, the task of drawing and describing all the sculptures of this kind found in that county, thus classifies the chief explanatory theories which have been hitherto brought forward:—

"As to the meaning of these markings, we are yet scarcely in a position to hazard a guess. Some have thought they are plans of camps. They do not, however, resemble the camps that are near them. Some conceive they are simply indicative of eternity, and shadow forth the soul's longing for immortality. Others think they have an astronomical reference; others that they refer to sun worship. Although considerable variety exists in them, there is not enough to admit of the supposition that they are hieroglyphical representations. The channel in which my own mind is running at present leads me to conjecture that they may be found to have a reference to the new state of being on which the soul entered at death, and that the development of that new existence might be supposed to be facilitated by the engraving of these characters upon the stones of the tomb, or of some rock in its vicinity. The time, however, has not yet come for expressing an opinion. But I trust that all who take an interest in the investigation will aid me by supplying any information or suggestion they may think useful."

To these theories may be added the one propounded by Mr. Dove in your own pages, which, if I understand it aright, considers them to symbolize the powers of life as radiating from a central sort of "*Anima Mundi*;"* while, finally, many eminent men, who see traces of the "Phallic theory," almost everywhere, are inclined to connect these mysterious symbols with that primæval worship. These hypotheses are confessedly very ingenious, especially that of Dr. C. Bruce. But, it may surely be asked, what collateral evidence have we that the rude Celt, or pre-historic man, who sculptured these mystic figures which are now puzzling his posterity, was familiar with any such deeply metaphysical dogmas as the above? Amidst so much uncertainty and variety of opinion among those so infinitely better qualified than myself to elucidate so difficult a subject, I trust it may not be deemed altogether unwarrantable to accept Dr. C. Bruce's invitation, and offer such suggestions as arose in my own mind on examining these archaic sculptures. First of all, I could have no doubt that they had a *religious*, combined probably with what may be called a *political*, meaning; and most likely were in some way connected with astronomy. I was at once strongly impressed with the conviction that their *form* was derived from that of the Megalithic circles, of which I have before mentioned there are several examples in the immediate neighbourhood; and the purposes to which these latter were applied seem to me to indicate the probable signification of the other. These noble hypæthral structures, of which Stonehenge, Avebury, Callarnish, and Stennis still remain such striking examples, were not only the temples of the most ancient people that have left records of their existence in our islands, but also their senate houses and basilicæ; their sacred places for worship and sacrifice, for making and executing the laws, and occasionally at least for sepulture, in the cases, we may suppose, of men whom they especially delighted to honour. And whether their circular form was originally derived from the visible appearance of the sun and moon and all the host of heaven, and their position determined by astronomical considerations, in accordance with what Wilson and others have taught us as to the position of some such circles at least with distinct reference to the one ever stationary Polar star,† and of others in connexion with "station stones" that marked the point of sunrise on the longest and shortest days; or whether the form naturally commended itself to the primitive human mind by its symmetry and facilities for placing all around at equal distances from the central place of sacrifice, while still divided into their several ranks by the intermediate concentric circles; or whether even, to the *initiated*, that ring-like figure, by its continuity, symbolized the idea of eternity, and, with its avenue of approach through successive circles to the central altar, conveyed to the more enlightened among them an esoteric conception of the passage of the soul to final perfection and felicity;—whatever, I say, may have been the original idea that led to the selection of these concentric circles round a central altar, and with an avenue of approach to it, the structure itself, its form and its distinctive features, must have been associated in the Celtic mind with the most solemn impressions of which it was capable. May it not, then, be well imagined that a conventional representation of these features, such as we see in these rock-sculptures, with their circles engraved round a marked centre, to which a channel leads from without, might very naturally pass into a sort of recognized sacred symbol, or hieroglyph?

Again, remembering how utterly ignorant

* The *anima* of which Mr. Dove speaks is the anima *hominis*—the human soul itself, as a concentrative principle—not the pantheistic anima *mundi*.—Ed. B.

† *Vide* Wilson's Prehistoric Annals of Scotland, vol. i., p. 166, second edition. 1863.

those rude tribes were of any of our modern modes of distinguishing a peculiar site, or commemorating an important event, is it at all improbable that this sacred symbol should be sculptured on the rocks near which they held any of their places of solemn assembly, far up in the hills, where the circles themselves which these symbols represented were not, and could not be, erected? Bearing in mind also the old traditional Celtic name which the rock bears where the largest collection of these petroglyphs occurs, "the Flat Rock of the Host, or of the Gathering," is it a very unwarrantable conjecture that when the tribes met here for unusually important objects, additional circles might be from time to time engraved by vote of the assembly, to commemorate the meeting and its results? These circles, while agreeing in general character, might vary in details (as we have seen they do) according to the subjects to be commemorated. Or might they not even record the distinctive marks of the principal chiefs, or septs, that were present, in a manner somewhat analogous to the tattooing of primitive races in other parts of the globe? or the cartouches of Egyptian kings? or, nearer home, to the characteristic tartans of the Highland clans? And thus, in process of time, these rock-sculptures would become the chroniclers of the tribes—the imperishable, even if obscure, records of the principal events in their past history.

It seems to me perfectly consistent with this view, that if, according to the opinion before alluded to, sacrifices were offered on the top of the rock, the blood might be guided through the circles representing the respective chiefs, or clans, and a more solemn sanction be thereby attached to the vote, or covenant, on which the assembly might have agreed.

Once more, if this sacred character of the symbol be admitted as probable, as well as its connexion with their holiest places of worship, and most venerated sepulture, it need not excite our surprise to find it occasionally engraved on the inside of cist covers; more especially if the above supposition be also conceded, that its peculiar form might bear some distinctive reference to the character, history, or rank of the chieftain, or priest, entombed therein. Still less extraordinary would it appear to find it engraved on the monoliths, or "standing stones," which must, at any rate, have had either a religious or a commemorative character, or both.

I have thus endeavoured to record the impressions that were produced on my own mind, after attentively surveying these Argyllshire Petroglyphs, and reading all the information I have been able to meet with on this very obscure subject. But I chiefly look forward with hope to the collection of facts which Dr. C. Bruce is known to be making from all quarters where the Celtic race have been established, for obtaining any real knowledge of this difficult question.

G. B. H.

MESSRS. NAPIER & HOPE'S LONDON SEWAGE SCHEME.

Preparatory to the discussion which is likely to occur, our readers may be glad to know what the scheme of Messrs. Napier & Hope, for the utilization of the North London sewage, as set forth by the projectors, really is. It consists in the construction of a trunk conduit, with two branches, traversing the whole of South Essex, from west to east; the one branch discharging into the sea on the Dengie Flats, the other discharging on the Maplin Sands, the river Crouch lying between the two branches.

The total length of the conduits will be about sixty miles; and it is now intended to irrigate the entire district along their course with the sewage, which, to a great extent, can be let out of the conduit by direct gravitation on to the lands. Where the levels do not permit this, the sewage will be pumped up into tanks, so as to command the higher ground traversed. Thus the whole length of the conduit is to be considered, they say, as a reservoir from which streams of liquid manure may be discharged on all the surrounding lands whenever required.

At the ends of the two branches the sands are bare at low water for from two to three miles wide, and arrangements will be made with a company already organized to embank these flats, so as to shut them from the sea two large estates, on which the sewage can be advantageously applied. It is not intended at the present time to advance the sea embankments to the full extent of sands uncovered, but only to a perfectly safe and moderate distance, reserving power to extend the enclosures at a future period, so that ultimately 20,000 acres can be reclaimed. But even with the limited area to be at first enclosed, added to the lands commanded in the course of the conduits, it is expected by the projectors that from 60,000 to 80,000 acres will be available on which the sewage can be used.

It has been stated that as much as 7,000 or 8,000 tons of liquid sewage per annum per acre can be used beneficially; but at Croydon only 3,000 tons per acre produce an excellent result. The quantity of the North London sewage will be about 100,000,000 tons per annum, which, if applied as at Croydon, would require 33,333 acres of land only. The working of the company will probably be to apply on such estates as they may acquire or inclose from the sea, the larger proportion of sewage per acre; and, on the farms along the course of their line, such modified quantities as the different crops and soils may require, and such as the farmers will agree to take. The company claim thus to command a large country on which to confer the benefits of cheap manure; a certain outlet on the coast, removed from all but a very thin population; an estate or estates of their own, in the most favourable position for the full realization of the value of the sewage by a scientific application to special crops; and, finally, they offer to the Metropolitan Board a share in profits which they expect will be considerable, and complete relief from risk of claims for damages on account of the discharge of sewage into the Thames at Barking. Mr. G. W. Hemans is the engineer.

THE SEWAGE QUESTION.

Under the title of "Metropolis Sewage and Essex Reclamation," an advertisement announces the intention (of Messrs. Hope & Napier) to apply to Parliament in the ensuing session for an Act incorporating a company to make and maintain the contemplated works for the transmission of the metropolitan sewage from the Northern Outfall sewers to the Essex coast, and for the reclamation of land on that coast; as also to authorise and empower the company and the South Essex Estuary and Reclamation Company to enter into agreements in relation to the latter company's undertaking. We give above an account of the scheme.

Following the example of the members of the Metropolitan Board of Works, the Bedford Commissioners have sent a committee to Carlisle and Edinburgh to inspect the sewage utilization works in these neighbourhoods. The committee have reported to their constituents on the subject; and in their recommendations to the Local Board, they say, —

"Having now submitted a brief account of our inspection of the sanitary works of Carlisle and Edinburgh, we cannot close our report without expressing our unqualified satisfaction with the principle of the sewage works and the general sanitary arrangements carried out at the former city, and we add earnestly recommend the Local Board of Bedford at once to adopt plans similar in principle. We are fortified in this opinion by the general expression of satisfaction by all classes of inhabitants at Carlisle at the completeness and efficiency of the works executed, and which have now been in full operation some years. We may mention that at the outset the Local Board had to encounter a most formidable opposition, but we are assured that the people generally are now fully satisfied as to the wisdom of the steps taken."

The report was adopted, and a committee appointed to take the question into consideration.

At Birmingham, a meeting has been held in the Town-hall, in reference to the utilization of the sewage. The mayor presided. Mr. Thomas Walker, a resident engineer, submitted his plans for carrying out this important work, and in doing it he estimated an annual profit of from 30,000*l.* to 40,000*l.* as the result. A resolution was moved to the effect that it is desirable the sewage of this district should be utilised by distribution over the adjacent lands; and, for this purpose, that the corporation be recommended to grant a concession of such sewage to a local joint-stock company. Mr. Hawksley, the engineer, spoke in favour of the plan suggested, at the same time deprecating the idea that the corporation could estimate or obtain any value from the sewage. The value would be obtained after a costly process, which a company might realize. Considerable discussion took place, and ultimately, it being thought that the subject was not ripe for decision, the resolution proposed was negatived.

At Dorchester, the Rev. H. Moule has been reading a paper to the local Farmers' Club, on "The best Mode of Utilising Town Sewage." Of course, Mr. Moule considers his own dry earth and closet system the best.

Sir,—Your continued exertions in the cause of humanity, in the purifying of our towns and utilizing the filth to the fertilizing of our fields, begin now to bear their fruit,—in the interest which the public begin to take in the matter. The journey of the members of the Metropolitan Board to Carlisle, &c., and their proposed application to Parliament for powers to utilize the sewage, show that, though slow to move, the public is alive to its own interest, when properly aroused and awakened. All honour to you, Mr. Editor, and may you "bear the palm."

In a long practical experience as a land surveyor, I have had much and great practical experience in observing the neglect and ignorance upon this vital subject. When fevers raged and caused the death of thousands, none or few considered that what was death to man was life to the plant, that by management and care, health might be restored to whole districts, and their fields bring forth their increase fourfold.

More than forty years ago, in my youth, I had the pleasure and happiness of being on intimate terms with a miller and a farmer, who was a self-taught engineer, and who turned his knowledge to good account to the public; in fact, he was a public benefactor, for he was the means of extensive districts producing two heavy crops of grass in a season where before there was only one. His mill was on the River Nadder, and he irrigated the pastures on its banks by converting them into water meadows. The landowners on the river soon had the advantage of his knowledge: in fact, many wide districts of the kingdom were indebted to the country miller. Men called "drowners," working practical men, were instructed by him, and their services, far and wide, were sought by large and needful landowners.

The miller was very careful to take the levels so that the water could be quickly drawn or drained from the land, for if allowed to remain beyond a certain point it is hurtful instead of beneficial, causing swamps instead of fertile pastures. The drowners know by practical experience when the water must be drawn off, as soon as a scum appears upon the surface of the water, it shows that it has performed its mission, putrefaction sets in quickly. I believe that to be the real cause of the failure at Rugby of the sewage experiment: provision had not been made properly for drawing off the waste water. As to the sewage being only applicable to some lands, it is all nonsense: it is applicable to all lands; it contains and holds the food of plants and grasses that grow on all soils.

The experiments made at Edinburgh, Carlisle, Croydon, Mr. Mechi's, and elsewhere, should be quite sufficient to convince farmers that it is their interest to obtain the sewage for their lands when it can be obtained.

G. O. Lucas.

METROPOLITAN AND OTHER IMPROVEMENTS.

Among the mass of what we may call Parliamentary advertisements there are some which we may more particularly notice: —

One seeks provision for the protection and improvement of Wimbledon Common, and the appropriation of a part of it (700 acres) as a public park or place for recreation. Earl Spencer, the proprietor, called a meeting lately at Wimbledon, and explained his views. His proposal was to inclose with a light iron railing that portion of the common lying between Kingston-road and the village of Wimbledon. It would be thoroughly drained, and openings would be left at intervals, affording ready access from all points. The present roads would be improved, new roads would be made, lodges built, and it would be generally ornamented and improved, and would be for ever dedicated to the public. He would become its superintendent, with the title of Protector. By-laws would be framed to come into operation when approved by the Home Secretary or some other Government official. These would regulate the details of the management. It was proposed to allow associations of a national character to hold meetings there, and it would rest in the hands of the Protector, acting with the sanction of the Government official, to determine to what associations this privilege should be extended. He would bear the current expenses of management and repairs. To meet this he would have the exclusive right of pasturage. The expense of the formation of the park and compensation to copyholders it was intended to meet by the sale of outlying portions of the common. The compensation would be fixed by the Enclosure Commissioners, and would extend to the rights over the entire common, or over such part only as would be affected by the scheme, according as the copyholders might prefer. Such were the outlines given of the very liberal scheme which his Lordship proposes to carry out.

Another of the advertisements relates to the metropolitan bridges, power to purchase and throw open which, so far as they are impeded with tolls, is sought from Parliament, with authority to levy a public rate for the purpose. It is proposed thus to deal with Southwark, Waterloo, Vauxhall, Battersea, Chelsea (Sus-

pension), Hammersmith, Deptford Creek, and Lambeth Bridges.

The Westminster Improvement Commissioners seek authority to form two new streets, one in substitution of New Tothill-street and Dacre-street, from the north side of Victoria-street, commencing at the west corner of No. 1, Victoria-street, Westminster Abbey, and terminating in the Broadway; and the other commencing in the Horseferry-road, at the south end of Artillery-terrace, running southward, and terminating in Rochester-row, at or about 315 ft. south-westward from the corner of Old Rochester-row. Other powers, especially for the consolidation of Acts, and the winding up of the commission, are also asked.

Under the title of "St. Clement Danes Improvement," power will be asked for to form an association, commission, or company, to effect sanitary and other improvements in the parish of St. Clement Danes, to provide dwellings for the industrial classes, to widen and improve that part of the Strand which lies between the churches of St. Mary-le-Strand and St. Clement Danes, and also to widen and improve that portion of Wych-street which lies between New-castle-street and the termination of Wych-street, near St. Clement's Church, and for other purposes.

A "Ramsgate West Cliff Improvement" Company is also projected, for the construction of an embankment, viaduct, or roadway to the West Cliff; a promenade or drive from the West Cliff Parade, close to Mr. Pugin's, to the village of Pegwell; and for other purposes of improvement at Ramsgate.

INSTITUTION OF CIVIL ENGINEERS.

DECAY OF MATERIALS IN TROPICAL CLIMATES.

THE paper read at the first meeting of the session, November 15th, Mr. M'Clean, President, in the chair, was "On the Decay of Materials in Tropical Climates, and the Methods employed for arresting and preventing it," by Mr. G. O. Mann.

The facts and experience recorded in this paper had reference particularly to the empire of Brazil, the author being the resident engineer and locomotive superintendent of the Recife and San Francisco Railway Company. It was stated that the temperature varied less, probably, than in any other quarter of the globe; but the seasons, which it was believed influenced the decay of materials to a greater extent than the temperature, were not so regular. Thus, the rainfall ranged from 60 in. to 120 in. per annum.

It had been found, on the Pernambuco Railway, that the half-round intermediate sleepers, of timber from the north of Europe creosoted, were in a better state of preservation than the square sawn, joint sleepers of the same material; still, after seven years' trial, it was evident that creosote, when properly applied to suitable descriptions of timber, would prevent decay. In white-sand ballast, since the opening of the first section of the line in 1858, the half-round sleepers had not suffered a depreciation of more than one per cent., while the square sawn sleepers had experienced a depreciation of fifty per cent. The author, after nearly seven years' experience, was confident that properly selected timber of the country would be found more durable than any description of wooden sleeper yet imported. It was advisable, in order to prevent decay, to cut the timber during the dry season, to select large and full-grown trees, to remove the whole of the bark and sapwood, leaving the heart of the timber only, and not to expose the sleepers in the sun when fresh cut, but to stack them in open piles under cover, through and about which the air could freely circulate for a few months.

Respecting timber in general, it was remarked that good timber for building purposes abounded in Brazil, in the greatest variety. Many kinds were impervious to the white ant, which insect generally selected the more porous descriptions, and particularly those in contact with the earth. Latterly it had been the practice to "pay" over with coal tar the ends of all timber built into the gables of buildings, or in any other position in which it was buried, or excluded from the air, and so far apparently with beneficial results.

The only examples of iron bridges in the province of Pernambuco, except that of St. Isabel, completed in 1863, were those belonging to the railway. The result of a careful examination of four of these structures, after they had been erected six years, was to show that the cast-iron pipe piles forming the piers, were likely to remain good for a considerable period; and that the upper structures of wrought-iron would also last well with ordinary attention. The only parts apparently affected were the wrought-iron bracings, and the bolts and nuts below high-water mark. With regard to the preservation of iron bridges, and of ironwork in general, for the tropics, care ought to be taken to insure the iron being perfectly dry before the paint, or any other composition, was laid on. Coal tar had been found to afford a most efficient protection. It was advisable that all small pieces should, before being shipped, be heated to a low temperature, and then brushed with and dipped in tar; the larger parts should be well cleansed, and the tar laid on while hot. Where tar was objectionable, linseed oil might be applied in the same way, and over this there should be a thin coating of zinc paint.

With regard to building materials, stone, wherever it could be obtained at a reasonable price, should be preferred for the abutments and piers of bridges. Stone imported from Portugal, for facing the churches, and in a few old Dutch works of the seventeenth century, had been found to be very durable. Great caution was necessary in the selection of bricks, as those made near the sea-board, with brackish water, were very susceptible to the weather, and mouldered away rapidly when exposed.

CONTINENTAL NEWS.

Belgium.—A company has just been formed in Brussels for the purpose of erecting a permanent Exhibition Building for Arts, Sciences, and Manufactures. The capital subscribed is three million francs, and a site has been taken at Laeken.——The Counts Egmont and Horn, who fell the victims to Spanish fanaticism, are about to have a monument erected to their memory on the square of the Hôtel de Ville. It will consist of a group of four persons, the two counts in the centre; on either side, a little back, two warriors. Unfortunately, it is proposed to place this group on the steps leading to the Maison du Roi (formerly known as the Broothuys), instead of erecting it in the centre of the square.

Prussia.—The new Exchange at Berlin, a model of which our readers will remember near the western dome of 1862,* is said to be anything but satisfactorily arranged. Much fault is found with a general want of accommodation, whilst room is wasted in arcades and corridors. In order to make space for reading-rooms, which are much wanted, the whole staff of telegraphists will be moved to the head station, in the Französische Strasse, and a pneumatic tube will carry thither all messages which may be written at the Exchange.——A new and very roomy gymnasium has just been opened in Berlin. These gymnasia will and can only be in favour amongst a people who seldom take more exercise than is absolutely necessary.——King Frederick William IV. was buried at the Friedenskirche, at Potsdam, on the 15th of October, and the figure of an angel has now been placed over the vault. It is a marble copy of the "Angel of the Resurrection," in the Church of Sta. Maria da Gloria, at Rome, and was ordered by the king himself to be placed where it now stands. The work was executed by Tenerani, sculptor, at Rome.——Cologne is just now very active in the work of church restoration. The dome of the Church of St. Gereon is newly repaired, the Church of Sta. Maria im Capitol is having its chancel and transepts cleaned and re-pointed, and St. Martin's is partly closed on account of repairs. The Committee for the "Dom" has published the amount of subscriptions received during the first nine months of the current year. The sum is 40,707 dollars, or about 6,100*l*. They also announce, that out of the 500,000 lottery tickets issued for the benefit of the "Dom" building fund, some 180,000 have already been sold at a dollar each. Parts of the Gurzenich or Guildhall are undergoing alterations, and the Rathshaus is likewise in the hands of the builders.——A cast-iron effigy of Emanuel Kant has been erected at Konigsberg, near the house in which he taught and died. The statue, together with its granite pedestal, is 18 ft. high.

Austria.—The great saloon of the Arsenal at Vienna is to receive the marble busts of all the chief warriors, from the founding of the empire to the present time. The busts, which are being executed by the sculptors Meixner, Hans Gasser, and others, will be ranged on either side, surrounded by trophies and weapons of their respective periods.——The following architects have been invited by the Minister of State to compete for the new Houses of Parliament:—Messrs. F. Schmidt, Van der Nill, Von Siccardsburg, Hansen, Romani, Schwendenwein & Ferstel, and Messrs. Zidek, of Prague, and Abl, of Pest.

* Now at South Kensington.

EXHIBITION OF ARTS AND AGRICULTURE IN CASERTA, ITALY.

IN a suite of rooms in the king's palace, an exhibition of the natural productions, fine arts, and industry of *Terra di Lavoro*, has been thrown open to the public, with the view of promoting a greater desire of progress in the husbandman and labourer of that province. On Sunday, the 9th of October, at ten o'clock, a meeting was held, where the deputations of the Academics of Naples, expositors, and other personages attended. Gennaro Mara, president of the Directing Committee, occupied the chair, and made an eloquent speech on the present condition of the country. He expressed a hope that the exertions of the Agricultural Association would be of great benefit to the labouring community. He complained of the want of a geological chart of *Terra di Lavoro*, and he hoped to see that important work accomplished. Mechanical factories are very scarce, and the most useful machines are imported from France and England; but the development of industry requires to be promoted by manufactories of those kinds.

The first saloon contains seeds and fruits, among which are enormous gourds, remarkable for their regularity of form, large beetroots, a very fine sort of potato, a peculiar class of lentils; and apples, pears, and other fruit of marvellous size and delicious flavour.

In the entrance court were arranged in the best order the exhibited machines, viz., a reaping-machine on the American system; Weston's patent differential pulley blocks; Turner's patent roller-mills for bruising corn; patent hand-power washing-machine for linen; double-action cotton gins, Mears by system, by Platt, Brothers; drag-harrows, and with spikes and for iron in teeth, for all purposes; portable horse-power (Norton's patent); portable corn-mill for 36-in. stones, on wood frame; iron drag-rake; set of horse work for three horses; horse-power thrashing-machine; thirteen-row drill, for wheat, barley, peas; rove patent iron cultivator, with five coulters; one combined thrashing and finishing machine, for an engine of 8-horse power; an assortment of the most approved English, Italian, French, and German agricultural implements, &c. The greater part of these implements have been exhibited by Messrs. Whitmore & Grimaldi, and public satisfaction has regarded the efforts achieved by them in representing at the exhibition the progress of agricultural machines.

In the meadow near the palace were milch-cows, remarkable for size, colour, and strength. The cattle-breeders have crossed the breeds, namely, Switzerland and Campanian. These were a race of English origin, and every species born in the province was perfect in its kind. But the exhibition in that field has been very scarce, because the political party have spread a report that the exhibition was for imposing a new tax on animals. This reminds us of the Arabs, who refused at first inoculation from the French, because they said that it was the seal of Beylic (government), for bringing their sons to France whenever they chose.

AN IRON AND CONCRETE CHURCH, FRANCE.

AN interesting church has been erected at the Park of Vesinet, near St. Germain, from the designs of M. Boileau, the architect of the Eglise Saint Eugène, constructed of wrought and cast-iron, and concrete or béton aggloméré, M. Coignet's patent. The St. Eugène church was the first in which the application of cast and wrought iron was made to a considerable extent, and when the design of the Vesinet chapel was being made, M. Coignet requested M. Boileau to try the experiment on a large scale, by substituting the concrete for stone. This was agreed to, and the result is that we have a monolithic church, its walls being in one solid piece, as well as the columns and mouldings for the windows, the open-work balustrades, and all the decorations.

The eastern entrance, with a porch, is surmounted by a tower, and is flanked on each side by a small chapel in the line of the side aisles. The church is divided into nave and side aisles,

separated from it by grouped slender columns of cast-iron, which rise as high as the side walls. From these spring pointed arches, of iron also, over the nave and over the bays separating it from the aisle; these arches carried up to the roof completely relieve the walls of the pressure of the arches over the aisles. All the roofing is externally covered with two layers of wrought-iron plate, separated a few inches asunder by a hermetically imprisoned layer of air. The length of the edifice is 170 ft. 7 in., and breadth, 55 ft. 9 in.; height to summit of arches of nave, 55 ft. 9 in., so that the breadth is equal to the height internally. The spire is to be 131 ft. 3 in. high. M. Michel Chevalier said, in 1855, with regard to this new system of cast and wrought iron edifices, "The mass of materials to be lifted to great heights is considerably diminished; the arching is considerably lighter and more permanent in its form; the lateral pressures, so dangerous, are almost all reduced into vertical harmless ones; an iron roof does not weigh upon the walls, and therefore we have been able to suppress counterforts and buttresses; the thickness of the walls is reduced to almost nothing; in fine, with half or perhaps one-third of the expense [of a stone structure] we can enter into possession of a building of the same surface, of a greater height, and of an unhoped-for elegance."

The park of Vesinet, formerly the forest and wood of the same name, is situate at the borders of the Seine, at foot of the terrace of Saint Germain, and forms a worthy rival to the surrounding enchanted spots,—Chatou, Croissy, Bougival, Port-Marly, Le Pecq, Montesson, &c.

M. Pallu, the spirited proprietor, has organised a colony of rural habitations, possessing not only the charm of a country seat, but the pleasures of a complete park, laid out with groups of trees, shady groves, rich flowers in abundance, cascades, and rivulets. Some idea may be formed of the vastness of this enterprise from the fact, that the watercourses through the grounds are of a united length of nearly forty-five miles, and an engine of 120-horse power is constantly at work. All the houses have water laid on all the floors.

ALL SAINTS' CHURCH, WINDSOR.

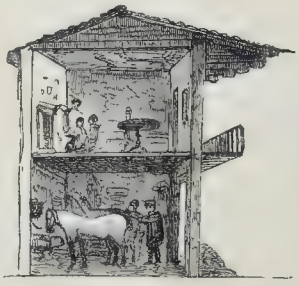
THE first stone of this church was laid by H.R.H. the Crown Princess of Prussia on Nov. 21st, 1863; and the building was consecrated by the Bishop of Oxford on Nov. 21st, 1864. The architect was Mr. Arthur W. Blomfield, M.A.; the builder Mr. J. D. Hollis, Windsor.

The church consists of a nave and south aisle, the north aisle as now constructed being only temporary, and serving as a passage to the nave seats: a spacious chancel, and a small organ chamber, with a temporary vestry below, complete the present building: there is a bell-turret over the chancel arch pierced for three bells.

The plan, when finished according to the architect's design, will comprise, in addition, a large western porch, and a detached campanile, a north aisle, and a transeptal chapel north of the chapel, with two vestries eastward. About 3,400*l.* will be required to carry out these additions, by which nearly 400 more sittings will be gained. It is seated at present for 600 adults; and the contract was taken for 3,800*l.*, but various ornamental details which have been added by the desire of the committee during the progress of the works will raise the total cost about 4,000*l.* The church is of lofty proportion; the roof is open; and the height from the floor to the ridge is nearly 60 ft.

The materials used in the building are red brick, with black bands externally: internally the walls are faced with ordinary bricks and red bands, red and black bricks being used for the arches. Bath stone is used for the heads and sills of the windows, and in bands, and for the capitals and bases of the columns. Forest of Dean and Bridgend stone are employed for the columns and small shafts in the nave: all those in the chancel are of Devonshire marble. The windows in the aisles are few and small, the chief light being obtained by a large clerestory. The chancel has a polygonal waggon ceiling, divided into panels by a chamfered rib, the whole decorated in colour. The general ground is a dull green, bearing medallions charged alternately with the emblems of the Passion and those of the Apostles, the panels being edged with a border of passion-flowers. Under the east window is a reredos in stone and coloured marbles, having a large cross in the centre under a circular arch, with the emblems of the four Evangelists at the sides. This, as well as all the carving in the church, was executed by Mr. Earp. Over the chancel arch, in a recess formed by the corbelling out of the bell-turret, is a large floriated cross executed in mosaic, from the architect's design, by Signor Salviati. A wheel window in the western gable has been filled with stained glass, presented by Mr. Cooper, of Windsor. A design has been prepared under the architect's direction, by Messrs. Heaton, Butler, & Bayne, for filling the east window, but funds are yet wanting for its execution. The seats in the body of the church are the simplest form of bench in stained deals: the chancel-stalls are of oak. The altar-cloth has been embroidered by a few ladies in the neighbourhood. The communion-plate, which is silver gilt, is from Messrs. Frank Smith & Son, who also made the lectern. The body of the church is lighted by a line of gas jets issuing from a string course running round the nave walls under the clerestory windows. Behind the jets is an ornamental band of incised plaster-work, which serves as a reflector. The chancel is lighted by two brass standards. The gas-fittings and the rest of the metal-work in the church are by Messrs. Peard & Jackson.

Life amongst the Horses.

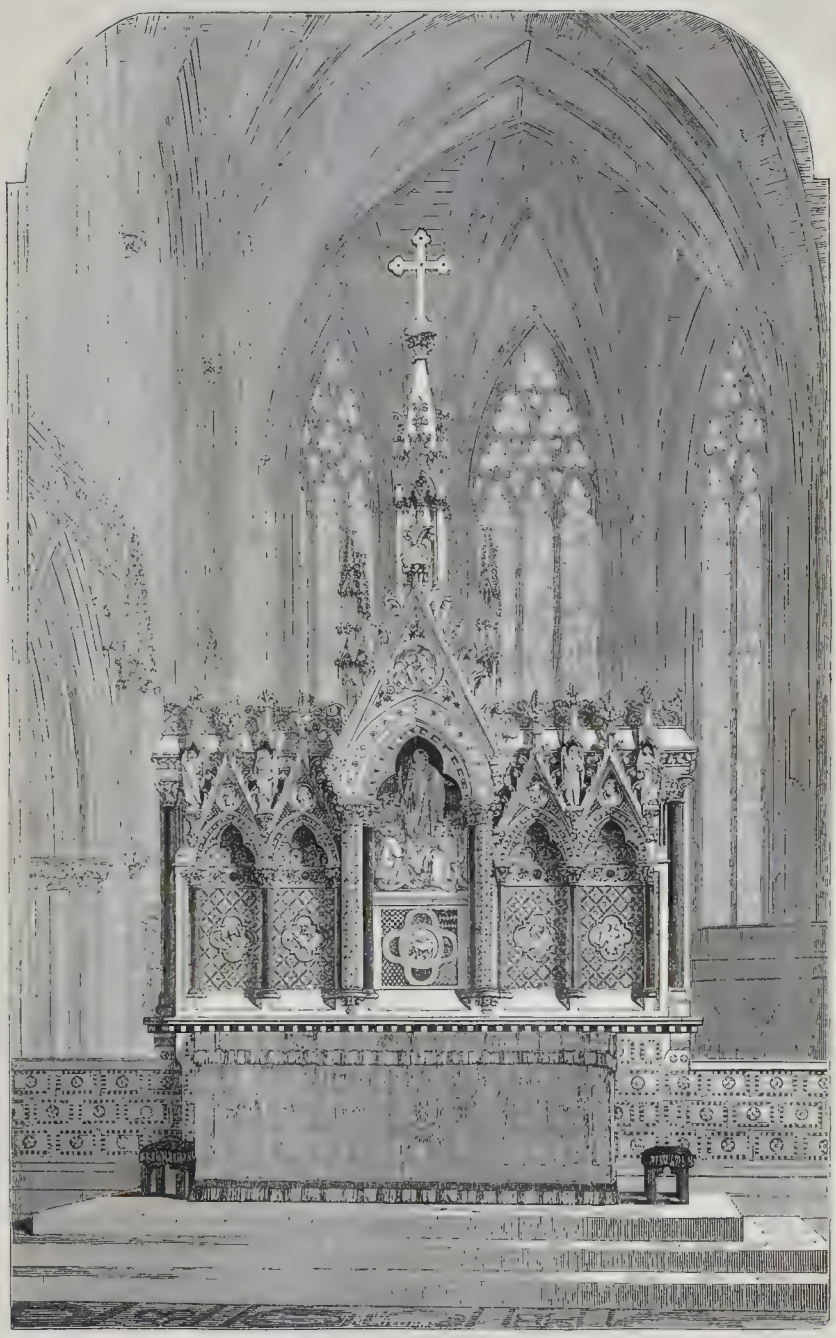


ACCOMMODATION FOR MAN AND BEAST.

A MEWS IN CLERKENWELL.

THE adjoining engravings show a condition of things which it is hoped will soon cease to exist in the metropolis. It may, however, be useful to give a passing note of it. The premises are situate not far from Coldbath-fields prison, and consist of a range of stables, which are reached through a square gateway. The central space for some hours of the day is used as a place for washing cabs. The pavement of the stables and yard is broken up and out of order; the cistern is neglected, and without a cover; and, in consequence, impure matters get into it, which render the water unfit for domestic use. At the time we called here, on a Tuesday morning about ten o'clock, the water supply was exhausted. Throughout the place there were indications of neglect, and the atmosphere was what might be expected in such a situation. The arrangements of the stables, either as regard ventilation or drainage, would not please any one who cares for or who understands the right management of horses.

On one side of the yard some rotten steps lead to a gallery, which is in such a state of decay that it trembles beneath the footsteps. Along this gallery, over the stables, there are several tenements. These rooms are very small, and the condition of the plaster-work cannot well be worse. The smell of ammonia in these apartments is as strong as in the stables below. In parts of the gallery there are two closets, without water supply or traps.



On the opposite side, also over stables, there is a workshop, in which a large number of men are employed during the hours of the day. In the basement of part of these premises there is a place for the reception of the stable refuse, which, for the sake of health, should be removed daily; but we are told that it is allowed to remain, and that, in order to save space, a pit has been formed, which causes the most unpleasant effects when the matter is removed. Glancing into this yard from the thoroughfare, the appearance of the gallery and projecting roof is picturesque; but few would think, until some inspection had been made, that it was inhabited. There is, however, a considerable population here, and sanitary care is necessary.

Sectional View.

NEW REREDOS, LICHFIELD CATHEDRAL.

THE reredos of which we give a view has been placed in the choir of Lichfield Cathedral within the last few weeks. It was designed by Mr. G. G. Scott, and executed by Mr. J. B. Philip. The whole, from top to base, is of alabaster, inlaid profusely with various coloured marbles from Derbyshire. The structure is arcaded, having a centre arch and two smaller ones on each side. The columns to the centre arch are richly worked in patterns and inlaid. The gable or canopy to this arch is surmounted with a carved finial, the crocketing being somewhat large and striking. Between the gables over the smaller arches are figures of angels, under canopied finials. The coped roof behind the gables is crowned with an elegant cusping. In the centre of the work rises a tall slender shaft and pinnacle, capped with a finial carrying a cross of slender form. At the angles of this centre shaft are four small columns. A bas-relief, the Ascension of Our Saviour, adorns the centre compartment of the reredos, and

NEW REREDOS, LICHFIELD CATHEDRAL.—Mr. G. G. Scott, R.A., Architect.
MR. J. B. PHILIP, SCULPTOR.

below this is the Lamb within a quatrefoil, surrounded by mosaic work. The other compartments have the symbols of the Evangelists, in bas-relief, with diapering as a background. The base, or screen, is divided into oblong squares, closely inlaid in pattern as a border; these, alternately green and red, have a patera in the centre, in relief. The total height of the work, from base to top of the cross, is about 20 ft., and the breadth is about 12 ft. The screen, of course, reaches from side to side of the choir. The arcading will eventually be extended on each side. We should observe, the back is as richly decorated as the front.

CAMBRIDGE ARCHITECTURAL SOCIETY.

At a meeting of this Society on the 17th inst., the Rev. G. Williams, of King's College, delivered a lecture on two coloured drawings of the interior of the Dome of the Rock,—popularly known as the Mosque of Omar,—at Jerusalem. He said that he did not like to have these interesting drawings in his possession for a time, through the kindness of the Count de Vogüé, to whom they belonged, without availing himself of the opportunity thus afforded him of bringing them under the notice of the Architectural Society. He complained that the histories of this Mosque, by Moslem writers, were so uncritical that they could not be relied on for an account of the decoration with which it was covered; but this defect in the written histories was happily supplied by inscriptions in the building itself, in which all the principal parts of the ornamentation were dated, generally with the name of the Caliph or Sultan by whose order it was executed. All the historians, and the traditions recorded by them, which go back to a very remote period, agree in this,—that the Dome of the Rock was first erected by Abd-el-Melik Ibn Merwan, in the 72nd year of the Hegira, *i.e.*, A.D. 691-2, and this date is recorded in an inscription in the Mosque itself; while the name of the founder has been altered by a later caliph, who had done much to beautify the building, and wished to have the credit of its erection. Part of the original decoration still remains, as, *e.g.*, the mosaics in the spandrels of the arcades which surround the dome and separate the two octagonal aisles. It was the Caliph Mamoun who substituted his name for that of Abd-el-Melik. He reigned from A.D. 813 to 833. He it was who covered the doors with bronze, and put plates of embossed bronze on the soffits and outer sides of the larger beams which rest on the columns of the aisles. The frescoes on the drum of the dome (corresponding to a blind triforium space and clerestory), which are very similar in general character to the original arabesque mosaics of the lower story, are dated 410 of the Hegira, but have no Caliph's name recorded. The latest restoration and decoration of the building, which was very extensive, was executed by order of Suliman the Magnificent, the son of Selim, who was Sultan of Constantinople from 1520 to 1566.

LONDON WALL.

At the first meeting of the Society of Antiquaries, last week, Mr. Tite, M.P., read an interesting paper descriptive of some recently-discovered remains of the Walls of Roman London. He stated that in the year 1853 a tesselated pavement was found by him under Gresham House, in Broad-street. This discovery had always led Mr. Tite to believe that similar remains existed in the same neighbourhood, further strengthened by the fact that in Trinity-square, just adjoining, a portion of the ancient wall of London still existed above ground, which, although not Roman, was supposed to rest on Roman foundations.* In 1841 the Blackwall Railway, much further north than this point, cut through Roman remains of the great wall, but beyond that slight indication, things remained in the same state until the autumn of this year. In August, 1864, certain large works were undertaken in Cooperrow for the erection of immense warehouses, to meet the increasing trade of London. These were intrusted to Mr. Clifton, architect, who in August of this year brought him a photograph of some curious remains discovered in executing these works. Mr. Tite visited the spot, and found a very extensive fragment of a Norman wall, with archer arrow slits and other defensive appliances. The fragment was 110 ft. long, and in height from the bottom of the foundation to the top of the parapet 41 ft. All the foundations, and a considerable portion of the lower wall, were undoubtedly Roman, built of square stones in regular courses, with bonding courses of Roman brick of intense hardness and excellent cement. Mr. Tite stated that the cement was so hard that he could not procure a whole brick for exhibition, but had obtained one broken in half. This specimen seemed to be as hard as any red earthenware, and was, as was always the case with the Roman, more of what we should call a tile, being about 1 ft. square and 1½ in. thick. The mortar between the bricks, unlike our modern system, was nearly as thick as the bricks themselves, and abounding in portions of pounded brick. Mr. Tite showed the exact place of these remains in an ancient plan of London in the reign of Elizabeth, when the walls and gates were in existence. He then pointed out a few other localities where undoubted Roman remains of these walls were traceable—viz., Camomile-street, the street still called London-wall, and near Moorgate. In referring to the history of Roman London, Mr. Tite pointed out that there could have been no walls at the time when Suetonius abandoned it in A.D. 61. He quoted some Norman historians, who referred the walls to a period as late as the Empress Helena, but his opinion seemed to be that they dated about the second century of our era. Mr. Tite pursued his history of the wall of London through its various phases of ruin and revival until the patriotic Lord Mayor, citizen, and draper, Ralph Joscelyne, in 1477, completely restored all the walls, gates, and towers, in which work he was assisted by the Goldsmiths' and other companies, and by Sir John Crosby, a member of the Grocers' Company. The gradual increase of the necessities of the citizens for more space, and the Great Fire of 1666, completed the destruction of these once important defences, and but few remains now exist to show their extent and value. Mr. Tite stated that the total area, enclosed by the walls, which still constitutes the great "City of London," is only about 380 acres.*

* If we remember rightly, there is no reason to doubt that the lower part of this wall is Roman. We take to ourselves some credit for having mainly assisted in preventing its destruction some years ago.

* In an earlier volume of the *Builder*, some papers, descriptive of the existing Remains of London Wall, fully illustrated, will be found.

THE CAPTAINS OF LABOUR.

The other day, when speaking of the opportunities which had fallen to his lot of forming a just estimate of the working classes, Sir Morton Peto stated, that for years past his firm had employed not less than thirty thousand men in their different works. These consisted, of course, of persons of various classes, who, as this great contractor remarked, were employed in different parts of the world, and comprised the people of many lands. Fifty or sixty years ago the guidance of so many hands by one head for any other than warlike purposes would not have been thought of. It seems even in these days a marvellous fact that Sir Morton Peto's army which is engaged in advancing the civilization of the world, should be as numerous as those commanded by the Duke of Wellington and other noted generals. Besides the advantage of the works which are completed by this enormous human power which is wielded by Sir Morton Peto, there is also to be taken into consideration the additional aid of steam, hydraulic power, and other applications by which, in part, docks, harbours, railways, and other constructions are made. And the amount of money yearly distributed by this firm for labour and for various materials must amount to a vast sum. We have no certain figures to go upon; but if we estimate the wages of all classes of the employed at 1*l.* a week on an average for each man, the item would amount to one million five hundred and sixty thousand pounds in the year. There are many other monster establishments; and it is one of the remarkable signs of the present age that these are constantly on the increase. The writer has noticed the beginnings of many of these now great establishments; their small and seemingly unpromising infancy, and, in spite of the unremitting exertions of the promoters, their slow growth up to a certain age, and then their sudden and wonderfully progressive increase. Then, perhaps, as years roll on, although the operations are so vast, the labours of the principal are less arduous than at first, for he has brought his establishment into working order, and by means of trustworthy heads of different departments on whom he can thoroughly depend, the machine, however huge its size, moves on successfully with comparative ease. A most interesting and instructive book might be written on the rise and progress of the great firms in the metropolis and the provinces. The results are not all good.

THE WANT OF SKILLED LABOUR.

After the delivery of Mr. Hawes's address at the Society of Arts last week,—

Mr. Hartley, as a manufacturer and large employer of labour, called attention to the great scarcity of skilled labour in this country, which he said was the case to such an extent that a very large amount of skilled workmanship had to be sent abroad to be executed. This was a subject which he hoped would be taken up by the Society. There were abundant means of supplying the requisite amount of skilled labour which an increasing trade demanded; and the advantage to in a boy being properly educated as a skilled workman was equal to giving him 600*l.*

Mr. P. Palmer expressed a hope that the influence of the Society and of the chairman, as a member of one of the principal City companies, would be exerted to induce those corporations to exhibit the rich treasures of works of art which they possessed for the benefit of the community. He thought it would well comport with the position and dignity of the great City companies to co-operate with the Society in the way he suggested in aiding the spread of the art education of the country.

Mr. Harry Chester might so far answer, on behalf of the council, the observations just made by stating that the question of skilled labour was one which had largely engaged the attention of that body. They were aware of the great want that existed. They were not, however, at present prepared with any particular plan from which they hoped to derive any great results in that direction; but it was a subject which in various forms had been always more or less before them. The exhibitions which had been suggested by the last speaker might have a tendency in that direction, and it would be most gratifying to the council to give their aid to any scheme which promised to be instrumental in carrying out the extension of their object.

"AMEND YOUR WAYS."

The dark and dreary month,—a time of drizzle, fog, and discomfort, particularly to metropolitan wayfarers—has again come round, after the October leaves have fallen; and now, unless better means are used than were formerly, we shall have those filthy and sloppy conditions of foot-paths and carriage-roads which have been so unfavourably commented on by people from the other cities throughout the three kingdoms, and even by foreigners. The damage caused to shoes and dress must amount to many thousands of pounds a year; and the labour of carriage and horse washing and cleaning must be as great as it would, under proper management, be unnecessary. So long as macadamized carriage-ways are in existence, there will always be a difficulty in getting rid of mud; but in Regent-street this has to a certain extent been managed, by a little extra care and expense; and, in other instances, the carriage-ways have been permanently paved with granite. Nevertheless, the condition of many thoroughfares was shocking during all last winter: it is to be hoped, however, that this vexatious nuisance will at length meet with some remedy. The law as it at present stands ought to be sufficient, if properly carried out, to mitigate the evil. Parish authorities are bound to keep thoroughly clean the roadways; and the occupiers of shops and houses are also compellable, *according to law*, to keep them clean. We notice that some occupants regularly attend to this duty; but, owing to a want of general co-operation in this work, the clean paths of the conscientious and diligent are soon overtrodden with the mud from neighbouring premises. There should be some power, if there be none already, which would strictly enforce the proper cleaning of the roadways by the parish scavengers; for unless this be done, it is not of much use to endeavour to keep the foot-paths in right condition. As regards the latter, both the parish inspectors and the police can

punish all neglects by a fine; and this persuasive is sometimes resorted to after snow-storms; but attention is quite as much required when the pavement is in a slippery state in consequence of the gradual damping of the mud, which in many cases has been allowed to remain for weeks together. Every house front, especially those in the main thoroughfares, should be thoroughly swept, and, if necessary, washed every morning, before a stated hour;* and if the proper purification of the footpaths were insisted upon, this might be the means of affording a certain amount of regular employment to boys and others who are connected with the industrial and ragged schools, and with the shoe-brushing brigades.

There is one point in connexion with the London footpaths that requires attention: we mean the neglected state of the frontages of churches and public buildings, long dead walls inclosing mansions, and so forth. The authorities of the British Museum deserve praise for the care which is taken around their own extensive structure; but in other instances the neglect is evident. Take, by way of example, the north side of new St. Pancras Church; the east side of the Great Northern Railway-station, at King's Cross; and the east and north sides of the House of Correction, Clerkenwell.

As regards the footpaths, we seem to be like the well-known person between two stools: we depend, on the one side, on the parish inspectors to attend to this duty; and, on the other, on the police: neither, however, seem to consider it any especial business of theirs; and so we have again to say, "Amend your ways."

LONDON DUST.

"Dust" seems to be increasing in value, and instead of being a source of expense to parishes has been made a means of profit. Nevertheless the impost of "beer money" is continued, the contractors still underpaying their men. This presses heavily upon the poorer classes, pent up in crowded neighbourhoods, where it is most needful that the refuse should be removed. In those neglected spots there is a difficulty in paying the beer money, and the men drive their carts to where they are more certain of their perquisites.

Now would seem to be a favourable time for the removal of this abuse. The parish authorities cannot complain of any additional and burdensome cost; let us trust, therefore, that in the granting of dust contracts, boards will make it a provision, that the men who collect the dust and drive the carts shall be paid a fair amount of wages, and that the beer money shall be entirely abolished. This may seem to some to be a small matter: experience, however, shows that in many ways it will be of advantage to health.

If an improved system of conveying the refuse from the homes of the poorer classes yield a saving of thirty or forty lives per annum in the metropolitan population, and prevent, to some extent, the spread of pestilential diseases, it will be work well done. The proper removal of the dust, also, leads to tidiness; for with the matters which have been thrown away spread over the yards, in consequence of the dust-bins not being able to contain them, there is not much encouragement for cleanliness. In wet weather, especially, the dirt is brought again into the house, and so one evil leads to another.

METROPOLITAN BOARD OF WORKS.

THE WOOLWICH EPIDEMIC.

At the weekly meeting of this Board, Mr. Bazalgette reported that it is confidently expected that within two months the Crossness pumping-station will be completed, and then the sewage on that side of the river will be discharged at high-water; and, being carried away by the ebb tide, will no longer flow up to Woolwich; but that there appear to be no tangible grounds for attributing the epidemic with which the neighbourhood of Woolwich has been visited to the discharge of sewage into the river. The sewage of London always flowed past Woolwich, while the sewage of the town was cast into the river at low-water opposite to it; and the state of the river was certainly very much more offensive at Woolwich four or five years since than at present. The report was ordered to be entered on the minutes. Mr. Doulton, M.P., asked the engineer whether the Metropolitan Railway Company had taken any steps to construct their line on the embankment. The engineer said the only information he had had was a letter about two months since from Mr. Fowler, the engineer of the proposed line, with respect to a question as to a station. Mr. Doulton said the Board would not care to see the embankment pulled up directly it was finished. The question was referred to a committee.

At the last weekly meeting of the Woolwich Local Board of Health, Mr. Knaggs moved for the appointment of a committee to inquire into the causes of the present great mortality in the district from epidemic disease. He said that the Registrar-general's report proved that the mortality at Woolwich now far exceeded that at the period when cholera raged in 1854. The prevailing epidemic, typhus fever, had struck down the wealthy and the cleanly, even more than the poor and those who were compelled to reside in crowded habitations. Woolwich was naturally a healthy town, twice as healthy as London; but now the rate of mortality was several times greater. After consideration, and obtaining all the information he could, he was convinced that this state of things arose from the discharge of the metropolitan sewage into the Thames at the outfall works near Barking Creek, or from defective trapping of the local sewers. At all events, a searching investigation was required. After considerable discussion, Mr. Knaggs's motion was adopted and a committee appointed.

* In some articles which appeared in the *Builder* on the state of Manchester, we mentioned the use of short hose with pipes fixed to a water-tap in front of the shops, which very effectually cleansed the flag-stones.

GLASS MOSAIC FOR EXTERNAL DECORATION.

From an article which appeared in the *Builder*, upon the "Discolouration and Decay of Stone in Buildings," it would seem that whether brick, stone, or cement be used to form the surface of a London building, in a few years that surface is covered with black in consequence of the smoky atmosphere which ever envelopes it. If the materials used be sufficiently hard to prevent the smoke from penetrating into them, it would appear that the washing by a fire-engine is the best way to remove the dirt; but if they be soft and porous, the smoke eats into them and forms a crust which only the cutting with a chisel will remove. It is also written in the article referred to,—"So long as the art-work and effects which architects produce are not lasting as the structures of former times, they can hardly come before the public with a clear conscience in advising the expenditure of money upon decoration." Now, sir, supposing that London architects were to find a good hard stone that they could always depend upon, even then would they be justified in cutting up that stone with delicate carving if in a few years it must be clodded with soot, and that soot could only be removed by the forcible ejection of water from a fire-engine? The architectural members of a building may be able to stand like men, and have their faces washed in a proper manner; but are the finely-cut lines surrounding delicately-carved foliage,—the children of these men,—which throw life and poetry into the whole,—are they to be exposed to this unceremonious treatment? Surely not: we might as well imagine one of the respectable female scrubbers at the sea-side deliberately standing with a young innocent in the teeth of a dashing wave to "bliss 'is little 'art" with a washing. The art will not stand it; and therefore if the washing must take place, the delicate carving should not exist. But we cannot have a true architectural structure without surface ornament. The question then arises, can we have any substitute for stone-carving in the buildings of our smoky cities? In my humble opinion, the best substitute we can have is glass mosaic. Clouds of smoke in a humid atmosphere may dirty it, but a good shower of rain will at once cleanse it. There can be no question as to its durability, and the colours, including gold and silver leaf, may be had of an infinite variety. The expense of this kind of decoration, however, is continually used as an argument against it; I think, unjustly, when we compare it with other kinds of surface-decoration, such as the carving of stone. The real expense consists, not in the material itself, but in the cutting of it: the smaller the pieces are, the more costly will be the work. Now, it is not necessary that we should have glass mosaic in pieces not exceeding ¼ inch square, as many persons seem to imagine. If the pieces were kept large, say averaging 2 square inches or rather more, I believe the cost would not exceed 10s. per square foot. This size of piece, moreover, will be found to be more in keeping with the architectural detail of a building, especially on the exterior, and at a distance from the eye in the interior.

I will take this opportunity of referring to a specimen of my own in glass mosaic, which has been exhibiting at the Conduit-street Rooms for several months past,—not to bring forward my own work in particular, which is by no means so good as it might be,—but to call attention to a new principle of decoration. I have called this particular kind of glass mosaic "painted opaque glass;" and I will say that the original idea of it does not lie with me, although my specimen was, I believe, the first publicly exhibited. Suppose we have a cartoon of a figure, or other decoration, intended to be used for stained glass, coloured, and with all the leadlines correctly indicated, we could produce in glass mosaic an exact resemblance to such a cartoon; that is to say, we could cut the different pieces out of glass mosaic, instead of out of transparent glass, and the cement lines in the former would take the place of the lead lines in the latter. Black enamel colour would be painted on the surface of the mosaic, and burnt in as in stained glass, so that the whole would be extremely durable. The advantage, then, of this description of work is, that for patterns and figures the pieces used may be large, and therefore the cost small; whereas, in the true glass mosaic, the pieces used for patterns and figures must be very small, and therefore the cost must be great. The former work would probably not cost one-fourth of the latter. It is surely time that this material had a fair trial in one form or another. Even supposing that it were to cost as much as is commonly supposed, the advantage gained in a town from its cleanliness, beauty of colour, and great durability, ought at once to recommend it. The great thing to obtain is good design, a just balance of parts, and the judicious arrangement of harmonious colour.

J. T. Lyon.

"THINGS TO BE DONE."

Surely your correspondent, "One who likes to Reap as well as Sow," is not an architect, otherwise he would rather deplore the *rapidity* with which large buildings in the present day are run up, than complain of the tardy movements of their builders. He asks, amongst other questions, When is the Charing-cross Hotel to be completed?

Did he ever ask *himself* the question how much thought and study are required of the architect to conceive and carry out so large a building, or how much of the reputation of such architect is involved in the successful solution of so difficult a problem? The architect of this building has already suffered most seriously in a former grand work, by the pressure put upon him as regards time, or his talent would have produced at Covent Garden a theatre that would have been a credit to the nation, and *worthy* of the son of the greatest master of Classic architecture that modern times have produced. We have now only a building that is remarkably fine, *considering the rapidity with which it was designed and carried out*; but surely this is but feeble praise. Charing Cross Hotel is suffering from the same cause, if one may judge from the lamentable absence of the *master's* hand in nearly all the detail. Scarcely can we perceive that even the *eye* of an A.R.A. has passed over all the minor portions of the work,—grand as the composition undoubtedly is as a whole.

Now, sir, you have frequently exhorted the younger members of the profession to spare neither time nor trouble in perfecting their designs, quoting Michelangelo's words, that such *trifles* make all the difference between *excellence* and *perfection*, and adding that blunders in stone ever remain to reproach and annoy. May not this exhortation with propriety be given to some of the more advanced members of the profession, from whom great things are expected, especially when they are honoured with the title of Royal Academicians or Associates?

The men of Sir William Chambers's and Sir Charles Barry's type are fast dying out, and generations to come will suffer by the commercial spirit that is being infused into that

which in former ages was a *divine* art, but now, alas! in many cases, is a mere business.

Your correspondent also asks when will the Houses of Parliament be finished? Much more important is the question, When will the Palace-yard front *be commenced?* We can well be content to wait for the completion. Let it steadily progress from year to year, and be as carefully studied in all its detail as the portion already carried out, and the nation will one day have reason to rejoice that it has reaped in due time abundant fruit from the *good* seed that has been sown.

THOMAS PORTER.

CISTERN WASTE PIPES.

A GOOD SUGGESTION.

WHEN the standing waste of a cistern is taken into a drain, it often happens that the small trap into which the end of the pipe is inserted becomes dry, from either the evaporation of the water or the absorption of the water by the material of which the trap is formed (a glazed paint-pot makes an excellent trap for this purpose). To remedy this evil, the most usual course is to adjust the ball-cock, that the water shall overflow the "standing waste" daily, and thereby (very unjustly, I think,) waste a very large quantity of the water supplied for consumption by the water company; and this expedient only answers for so long a time as the ball-cock remains in the same working order as when it is adjusted. With your permission, I will describe to you another means, and a very simple one, too, of effecting this object.

Take a hank of stout knitting-cotton, say 18 in. long (one pennyworth, at the present price of cotton), and having doubled it, tie one end to the outside of the standing waste 9 in. from the top, and let the other end or 9 in. hang down inside the standing waste: the effect of this will be, that when the cistern is full, or within some inches of being full, the water, by capillary attraction, will travel up the cotton and over down the waste-pipe (very slowly, say half a pint in an hour), and thus keep the trap constantly charged. This is a self-acting trap-supply, which once fixed will never fail, and will be the means of keeping back the drain gases, not only from contact with the water in the cistern, but from contaminating the air of the whole house. I may here say (from experience), that the want of water in these small traps is a fruitful source of stinks in a house. The basement cistern is, more often than not, in some out-of-the-way place, and consequently has no attention; and the ball-cocks, many of them, are but cheap and sorry affairs: the trap at the end of the cistern waste emptying itself into the drain, being empty of water, the gases from the drains, and *worse, from the street sewers*, have free access into the house, from basement to attics. The inhabitants are often sickened and almost poisoned by stinks, and they cannot tell whence they come; and all this annoyance and possible illness may be avoided by this very simple means. Need I say, that this appliance would adapt itself well to the syphon standing waste described by a former correspondent.

W. H. C.

A NEGLECTED "TOWN" ON THE SEVERN.

SIR,—Seeing the remarks in your paper as to a *city* on the Severn, I wish to draw your attention to a town on the same river, the capital of the county of Salop, with a beautiful neighbourhood, and possessing scenery in its environs quite equal to that of Worcester. The last census I cannot now refer to, but I believe the population is over 20,000, and I think you would find it difficult to name a town so well circumstanced for railway communication to all parts of the British empire, and where the inhabitants have made so little use of the advantages placed in their hands. I know now several parties who have been on the look-out for dwellings in its neighbourhood, but none are to be found. Capitalists seem to think that it is of no use to build unless the order be given specially. I was looking over its environs the other day, and I found one solitary house erected this summer. The town itself is a discredit to the present age; there are the old pebbles for its foot-pavements in some of its best streets. Improvements there are none, save and except the railway buildings and stations that are going on. There is its noble quarry. But progress seems quite at a standstill; new streets or squares, or improvements of any sort seem not to be thought of. Narrow streets as well as filthy alleys remain. As they were in the beginning, they are now, and ever shall be, seems to be the motto of the folks at Shrewsbury. I wonder your "Lover of Progress" did not begin with Shrewsbury town itself as a start, where he might have taken boat, and slid down the river to Worcester. I write in the hope that the people may arouse themselves from this state of torpor, and bring capital and enterprise to bear upon the improvement of the town. The people seem all asleep to the advantages of their situation.

PROGRESS.

LIMES AND MORTAR.

IN your last impression I read an article, by "F.R.C.," on the important question of the method of using lime. He gives it as the practice in Southern Italy to slake the lime for a considerable time before use. My experience, after many trials and careful attention, convince me that, for all rich, fat, or very meagre limes, this is the best plan; but it is, of course, necessary to keep the lime from contact with the air, by submersion or otherwise. With limes that are moderately or even slightly hydraulic, I hold such a process injurious; as, when once these limes have begun to set, they should not be disturbed, as the setting properties cannot again be restored except by a second calcination, to drive off the chemically combined matter. I think many of the excellent pieces of masonry found in Italy, which have been executed with rich limes, owe their induration in a great measure to the puzzuolanos and other volcanic earths which have been added to the mortar.

J. C.

THE LOCAL TYPE OF ARCHITECTURE.

IN former letters I have endeavoured to point out the superior chasteness and delicacy of English Gothic over French; and now I would only say a few words on keeping to our local types of building. Premising that the architecture of each county is that best suited to its wants, from the fact that it grew up in that county to meet the wants thereof without external aid,—I maintain also that the architecture of each county is that best suited to surrounding scenery, and best expresses the local mind. To keep up, then, these types is for us a matter of tradition, which we can only break through by disregard to common sense, and by an utter want of poetic feeling.

We are nationally bound to keep up the local type. A Lincolnshire church would be quite out of place in Sussex. Norfolk, Oxfordshire, Sussex—each has a local type of domestic building, admirably suited to those counties respectively. But the great fault of our age is in building rich Lincolnshire parish churches in small villages. In a small village you want a simple church. Nothing can equal the simple Sussex church, with its wooden bell-turret, so admirably suited to the county and its wants. It is monstrous to go and build a young cathedral down in such a neighbourhood; it is all out of place, and becomes a perfect parody. It seems to me that our architects can build cathedrals; but they can do nothing simple. I want to see them build a simple village church.

O. O. O.

ARCHITECTS' STRUGGLES.

SIR,—I was one of those happy individuals who paid 150*l.* premium, and gave myself up to five years' theoretical work in a fast office at the West-end (now extinct), and maintained myself during that time, and for two years' afterwards, while improving (?) in provincial offices.

Finding it difficult to obtain employment, I got one of the committee of a proposed building to get me appointed as clerk of works to it. I went again as clerk of works, and again several times, and once as a general manager or clerk of works to a building firm. Now, at first, this hurt my architectural dignity; but I am fully aware of the benefit I have derived from it since, and am quite satisfied that a man cannot be a *practical architect* without having superintended *buildings* daily, and for two or three years. The above I think quite sufficient to entitle me to the term "Architect." But what's in a name?

I really wish some fellow would invent another term for it; for instance, I have been established about five years, and I find I am surrounded by a tribe of small joiners or builders, who *do plans* and style themselves "architects," men working at the banker, who style themselves C.E.s (for the latter, I refer you to Mr. Forrest, secretary of Institution of Civil Engineers, and my correspondence with him, Aug. 3, 1864); and, worse than this, individuals who do work as architects at 2½ per cent., and less.

S. A. L.

CROOKED CHIMNEYS AND THE MACHINE.

SIR,—I thank you for the insertion of my letter about crooked chimneys. Your editorial P.S. about "soot-doors," reminds me of my youthful days, when I offered in vain 100*l.* for a cure for chilblains, and was further gravely assured by a celebrated lecturer on anatomy, as to the disease in the teeth called "caries, or decay," that the remedy was "extraction!"

Why, sir, I have flogged my feet with holly, as a school-boy, and had them sewn up in wash-leather; but, teazed, teazed, and irritated by chilblains, I could not get through my necessary calculations at Christmas-tide with any peace or comfort.

We hear a vast deal in these days about "high art"—about the vast superiority of our Continental neighbours in elegancy of design, &c. I heard enough, and more than enough, about these things, during the five or six weeks I served as a juror in the Exhibition of 1851; but pray, sir, let me plead with you on behalf of the commonsense and utilitarianism of Englishmen.

I inclose you some very sensible remarks in a letter addressed to a provincial journal. The writer tells you that we won't have our rooms disfigured and knocked about with "soot-doors;" and, I may add, we won't have our houses endangered and smoked by them. I have been gravely told by my builder that my chimneys ought to be swept every four or five weeks. Why, sir, he ignores the nuisance to pictures and furniture of every single sweeping. Pray, sir, do tell our young aspiring architects that it behoves them to provide or suggest some practical remedy for the nuisance of crooked chimneys.

AN OLD J.P. AND D.L.

ACTIONS UNDER PUBLIC HEALTH ACT.

Caley v. *The Local Board of Health of Hull.*—This case (in Court of Queen's Bench, Westminster) raised a rather important question under the Public Health Act, 1848. That Act provides (sec. 68) that the Local Board may from time to time cause the soil of any street to be raised, lowered, or altered as they may think fit; and then the next section (69) enacts that in case any street be not levelled, paved, and channelled to the satisfaction of the Board, they may require the occupiers of the premises therein to level, pave, channel, &c.; and, in default, may cause it to be done, and charge them with the expense. The street in which Caley, the appellant, resided, was required by the Board to be raised to the level of the adjacent street; and, in default of the occupiers, they caused it to be done, and charged the occupiers with the expense. He refused payment of his *quota*, and Mr. Travis, the magistrate at Hull, made an order upon him to pay; stating a case, however, for the opinion of this Court, to raise the question whether the enactment extended to such a case, or applied merely to the removal of inequalities, &c., in the particular street.

The Lord Chief Justice, interrupting the counsel, pronounced judgment in favour of his client, the appellant, on the ground that the word "level" did not extend further than to inequalities in a particular street, and did not extend so far as to enable the Board to raise its level with reference to the level of surrounding streets in the town or borough. The order, therefore, was made without jurisdiction.

The other learned Judges concurred.

Judgment for the appellant.

METROPOLITAN BUILDING ACT.

Recesses in 9-in. Walls.—Mr. Knightley, district surveyor, summoned Mr. T. Harvey, of River-terrace, Chancellors, Hammersmith Police Court, for forming recesses in the external walls of a building in Chancellors-street, with backs of half-brick thickness, which is contrary to section 13, rule 1. The case was adjourned for a week, to enable Mr. Harvey's legal adviser to acquaint himself with the facts; but, as there was no answer in justification of that form and manner of construction, the magistrate made an order directing the backs to be constructed 8½ in. in thickness.

District Surveyors' Fees.—At the Clerkenwell Police Court, before Mr. D'Eyncourt, Messrs. Kirk & Parry, of 4, Little Queen-street, Westminster, builders, engaged in erecting a warehouse and printing factory, in Bovay-place, Holloway, for the Printing and Publishing Company, were summoned by Mr. Turner, the district surveyor of East Islington, for refusing to pay his fees.

Mr. Knight, Messrs. Kirk & Parry's agent, appeared and was permitted by the magistrate to represent those gentlemen. Mr. Turner's case was conducted by Mr. Joseph E. Turner, from the office of Messrs. Hilliard, Dale, & Stretton, who stated that the buildings erected were divided under section 27, rule 4, and therefore he argued were two buildings proper, according to rule 1; and that, although united together under section 28, which they were, and which is permissive as to uniting buildings, this section of the Act clearly recognizes the two as separate buildings (always speaking in the plural), and that two buildings could not be united at all, except under the provisions of rule 3 of the section.

Mr. Knight argued that, dividing the building as directed by rule 27, did not make the party-wall come within the definition of party-wall, section 3, inasmuch as it was not built "To be used as a separation of any building from any other building, with a view to the same being occupied by different persons;" and in fact it was only a division of the one building into two compartments, the whole being in one occupation.

The district surveyor and Mr. Knight agreed that the wall was built in every way as required for a party-wall, except that Mr. Knight observed the openings had been made as the work went on, in accordance with section 28, rule 3.

Mr. Joseph E. Turner then called the attention of the magistrate to the definition of cross-wall, section 3, which states,—"It is to be used as a separation of one part of any building from another part of the same building, such building being wholly in one occupation;" and on reference to Part 2, Miscellaneous, rule 1, it is stated the thickness of cross-walls shall be two-thirds the thickness "required for party-walls." Therefore the Legislature clearly, when it required a large warehouse building should be divided by a "party-wall," meant it to be separated as two buildings, either of which might become occupied by different parties; or they would have said it should be divided by a *cross wall*, and have given the public the

dvantage of making it of the lesser thickness required for such a wall. Section 28 again favoured this view, inasmuch as, by rule 4, the openings allowed to be made in the party-wall when the two buildings were in one occupation, are directed to be "stopped up with brick or stone, of the full thickness of the wall," when they cease to be.

Mr. Knight urged that section 28 did not apply at all to a large warehouse building directed to be divided, but to uniting old buildings only.

Mr. D'Eyncourt gave his decision, that by reason of the requirement of the Act, that a party-wall should be erected, which had been done, it made two separate buildings, and therefore two separate fees were chargeable.

BUILDERS AND WORKMEN: THE LOSS OF TIME QUESTION.

At the Shoreditch county court, on the 15th, was tried the action of *Shannon* v. *Myers & Others*. Mr. Steadman, who appeared for the plaintiff, a journeyman builder, said that the question involved in this proceeding was one of the very greatest importance to the whole of the building trade, and it would be for the Judge (Mr. Dasent) to say whether the plaintiff and other labourers employed by builders were entitled to be paid for loss of time. The plaintiff had been employed upon a job for which he was paid 4½d. per hour; but hearing that other men were getting 5d. for the same work, he applied to the foreman for a rise. This the foreman promised to consider during breakfast time, but when plaintiff came back to his work after breakfast, he was ordered off the ground. He was not paid his money, but had to wait for a time; and he was at length given a ticket which he was ordered to take to Belvedere-road. To this the plaintiff objected, but he was finally obliged to go to Belvedere for his money, and in doing so lost four hours and a half. To recover the money for this the present action was brought.

The Judge could not see how the action would lie.

Mr. Steadman pointed out, that his client was paid by the hour or even half-hour, and he could not be considered to be discharged until he had actually received his money. There was no complaint made that the defendants had suddenly dismissed the plaintiff, because it was an understood thing in the trade that each side should have the power to dismiss the men or throw up work at any moment of the day.

Plaintiff said, I had been in the employment of the defendants upon a job at the Imperial Gas Works, Haggerstone, for five weeks up to Saturday, October 8th. I was paid 4½d. per hour. I learned from some of the other men that they were getting 5½d., and I spoke to Mr. King, the foreman, about it. On the morning of Monday, 10th of October, King said he would look into the matter; and I went to breakfast.

Judge.—Were there any more besides yourself that required this rise?

Plaintiff.—Yes. There were eighteen more men. When we came back from breakfast there were two policemen at the gate, though they were not at all required, and those policemen handed us in two by two. When I got inside, I had a ticket offered to me for my money. There was no reason why I should have a ticket, as I had never been paid that way before.

Judge.—When you asked for the rise, what did you say?

Plaintiff.—I pointed out that Messrs. Lawrence & Co. and other large builders, paid the 5½d., and King replied that he could not do anything in the matter unless he saw Mr. Myers. There were due to me six hours and a half on Saturday and two hours on the Monday.

Judge.—How comes it that there was money due to you for the Saturday's work?

Mr. Steadman.—The master builders and contractors always keep Saturday's money until the following week.

Judge.—Well, what happened after you obtained your ticket?

Plaintiff.—I went to the Worship-street Police Court and saw the magistrate. He heard my complaint, and sent a summoning officer to the foreman. When the case was called on, I was left outside the court, and after this a person came out and said it was all over, and the magistrate had decided against me.

Mr. Steadman confessed that this was all new to him. He was holding the brief for a counsel who was not present.

Judge.—I do not sit here to revise the decisions of police court magistrates. You have chosen the tribunal to which you would appeal. You went to the police court and made your statement; and I can easily understand why you were not admitted again. Having heard you, all that the magistrate had to do was to hear the other side; and having done so, he decided against you. It is not for me to say that his judgment was wrong. I may add, I set my face entirely against this loss of time question. The verdict will be for the defendants.

STRIKES.

The operative carpenters and joiners of Bursledem and Tunstall having submitted to the master builders of those towns a revised code of rules for the regulation of the hours of working, &c.; and a number of the master builders of the "Staffordshire Potteries Branch of the General Builders' Association," on the other hand, have held a meeting, at which eleven rules in reference to the hours of labour and other matters have been adopted "for the operative carpenters, joiners, masons, bricklayers, &c.," and which have since been published. The following note is appended at the foot:—"N.B. That as a discharge note will be given on and after the 1st of January next, 1865, the above rules will come into operation at the same time."

At Accrington the guardians lately received a deputation of four operatives employed on the public works. Having heard their complaints, the guardians resolved to reduce the work of the single young men in receipt of 2s. 6d., and the married men in receipt of from 2s. 6d. to 6s., from thirty-three hours per week to twenty-four. The deputation seemed to think the alteration would meet the views of their fellow operatives.

There has been a strike of the quarrymen in the employ of Messrs. Pictor & Sons, Bath stone merchants, at their Box ground stone quarry. It appears that the men wanted a farthing per foot cube extra on the price agreed, on all stone dug from the 1st of November till Christmas. To this Messrs. Pictor & Sons would not agree; but they offered the farthing extra for one month, as they expected the demand to be less in a month or six weeks. The men, after consulting, would not accept of the offer, but ceased work, the whole leaving the quarry in a body. A written notice was sent to the principal men of them, requesting their attendance the next morning, in order that their work might be settled off. They came, and one-half of them agreed to go on work without the farthing per foot asked. Messrs. Pictor & Sons told the remainder that, seeing they had struck work, they would not now give the farthing even for the month. In the course of the next day the remainder agreed to go on, and began to get their men together again. All are now at work.

LINCOLN SCHOOL OF ART.

The annual distribution of prizes to this school has taken place. The mayor was in the chair, and the Bishops of Lincoln and Oxford, and Mr. Bromley Moore, were present, together with a large attendance of influential persons, partly in celebration of the opening of the new school in Silver-street.

The Bishop of Oxford, in his speech seconding a resolution, spoke of beauty in art and its commercial and other advantages.

"The appreciation of art," said his lordship,—"the appreciation of beauty, which is after all the high idea that lies behind all true art,—the perception of what beauty is, is itself given as a first gift to very few in anything like its perfectness. Here and there is a gifted spirit which seems intuitively to have the eye open so that it does perceive thoroughly, and relish purely, that which is, in its true and highest sense, beauty. But this is the exception, and in all schools and in all bodies gathered together to aid others, it is not for these great geniuses, who have their Heaven-sent gift in its perfectness, but it is for the great number who come to them, who are not dullards, who are not without the capacity of entering into what beauty is, but who still, without the cultivation of the faculties which God has given them, will not be able to perceive it: it is for them that Schools of Art and such other assistance are designed. The dower of honest labour, but not the dower of a very high appreciation of beauty in itself, is the natural gift of this English people. If so, observe that a great commercial people has to export not only machines of wood and of iron and the like, but, if it is to compete with other producing nations, it must produce works in which art mingles very highly—for instance, all the patterns upon the fabric in different materials made in the land. In this, as in everything else, the demand must regulate the supply; and if the demand in Great Britain is for hideous things the supply will be hideous things; and the producer will be guided from his own notions of taste and artistic skill by a rule which everybody else would call very hideous. That being the case, I say we must begin by educating a very broad superficies of the consumers of the material, in order to bring their rectified taste to bear upon the producer of the material; that the rectified taste so raised may be brought to bear upon the persons employed to draw the designs and to furnish the materials which are to become afterwards a great matter of export from this exporting country."

The Bishop of Lincoln spoke of the influence of the practice of art on the mental faculties.

"When a youth," remarked his lordship, "has to draw from a copy—still more when he has to draw from a model—he is obliged to mark every minute difference of form and shade. If he lets any portion escape, his copy is incorrect—he can hardly see why it is, but it is gone. Therefore, he is forming the habit of close personal observation—the habit of concentrating his attention upon the matter he is about; and in that lies the secret of intellectual excellence. God has mercifully given us, in the use of our faculties, a source of one of the highest and purest pleasures; and while, on the other hand, He makes it our duty to use all our faculties for some useful purpose, so on the other hand, He has given to us the privilege of enjoying the pleasures attached to them. Now, though it may be perfectly true that the faculty of appreciating works of art or beauties of nature varies in individuals, no less than in different nations, in nearly all they are capable of very great development; and if so it is not only allowable, it becomes almost a duty to avail ourselves of that blessing which God has given us to enjoy that amount of wholesome pleasure which he has put within our reach."

During the meeting a valuable timepiece was presented to the master, Mr. E. R. Taylor, by Mr. Richardson, on behalf of his fellow-students, in token of their esteem.

Monumental.—A small model of the Rowland Hill Statue for Birmingham has been made by the sculptor, Mr. Peter Hollins. Sir Rowland is represented standing, one hand resting on a pillar. He is dressed in modern costume.

COMPETITIONS

Farnham New Market House and Town Hall.—Of the several sets of designs sent in by architects competing for the above, that by Mr. Tarn, of Great Russell-street, London, has received the first premium of 50*l.*; and that by Mr. Wonnacott, of Farnham, the second, of 20*l.*

The City Offices Company.—This Company are taking steps to utilise the large estate lately purchased by them in Bishopsgate-street Within, adjoining Crosby House, and nearly opposite St. Helen's-place, the sale of which to the Company we noticed at the time it took place. They have since acquired two houses in Old Broad-street, by which means an entrance has been obtained from that side. The Company have invited a limited number of architects to send in designs for laying out this property to the best advantage, leaving the disposal of the space and the question of style and cost to the discretion of the competitors; the only material stipulation being that the drawings should be tinted in sepia or India ink, and not fully coloured.

Fulford Parish Church.—In reply to the advertisement for designs for this church, fifty-five sets of designs were submitted, and the one by Mr. Pritchett, of Darlington, has been selected.

PROVINCIAL NEWS.

Chatham.—The new police court, New-road, Chatham, has been opened. The court for the transaction of public business, says the *South-Eastern Gazette*, is exceedingly commodious, the lighting, heating, and ventilating arrangements being as perfect as possible. Lighted by means of a lofty lantern roof, there is plenty of ventilation, which can be judiciously altered. The court is so arranged that magistrates, suitors, solicitors, witnesses, and the general public have all their places. The cells in which the prisoners are confined previously to the examination communicate directly with the court, thus no longer necessitating prisoners, prosecutors, and witnesses all being together, as has hitherto been the case. Adjoining the court, residences are provided for a certain number of police, a gaoler, and superintendent of police, together with stabling, magistrates' rooms, clerks' offices, waiting-room for the witnesses, and other arrangements. The entire building, with the interior fitments, &c., has been erected by Messrs. Naylar & Son, of Maidstone and Rochester. The buildings are from the designs of Mr. Martin Bulmer, the county surveyor.

Deal.—The pier erected at Deal has been formally opened, Mrs. Hugesson, the wife of one of the Cinque Ports representatives, having performed the ceremony. The day was one of general rejoicing in the little town. The dinner which followed the opening was attended by the borough and county members. The pier is constructed entirely of iron. It is 1,100 ft. long, 25 ft. wide, and has a T shape; the head is 120 ft. long, and 50 ft. wide, the abutment being 100 ft. by 407 ft. The body of the pier rests on about fifty ornamental iron columns, of about 18 in. in diameter, which are screwed into the rock: they are tied horizontally by diagonal braces of wrought-iron, and are surmounted by ornamental caps. The pier-head, where steamers can be moored alongside in any state of the tide, rests on the same kind of pillars as the body of the pier, but for greater strength they are tied diagonally, vertically, and horizontally, and are surrounded by a timber fender. The work has been executed under the immediate direction of Mr. Reid, the superintendent. Along each side of the pier is ranged a continuous seat, the back formed of an iron network, which forms a finish to the top of the structure. At the entrance there are two toll-houses, and at the head there is a corresponding shelter-house, which it is expected will be used as a reading-room. Mr. E. Birch acted as engineer; and Messrs. Laidlaw & Son, of Glasgow, undertook the actual erection of the pier.

Shanklin (Isle of Wight).—The foundation-stone has been laid here of a literary institution, to be erected in Grange-road, near the Post-office, on a piece of ground presented for the purpose by Mr. F. W. Popham, the lord of the manor.

Llyswen.—The foundation-stone of a new rectory house for this parish has been laid by Messrs. W. Powell Jones, the rector's wife. The new parsonage is to be built from a design furnished by Mr. Joshua Daniels, of Crickhowell, architect. Mr. C. Evans, of Talgarth, is the

builder. Lord Tredegar and Sir Joseph Bailey have, with their accustomed liberality, presented the stone from their Spendil quarries in this parish, free of royalty.

Bingley.—The new Mechanics' Institute, in the main street of the town of Bingley, has been inaugurated. The institute has been built from the designs of Mr. Waterhouse, of Manchester. The style of architecture is Gothic. The institute consists of a large school-room for the accommodation of the evening classes; four class-rooms, for the teaching of the more advanced branches of education; a library, news-room, and a large hall for the delivery of lectures. This hall is decorated, and is capable of accommodating upwards of 500 persons. The building and furniture have cost 2,600*l.* The opening was celebrated by a *soirée*.

Preston.—For years there have been discussions as to the policy of constructing a new workhouse for the Preston Union in place of the half-dozen now in use; but the question was not finally decided until now, when it has been resolved at a meeting of guardians, by 36 votes to 19, to erect a building at an estimated cost of 32,000*l.*

Keswick.—The re-building of the Queen's Head Hotel has been let to Mr. Hall, of Carlisle, the contractor for the new Railway Hotel.

Hull.—A joint-stock company, on the limited liability principle, has been commenced for the purpose of rebuilding the Theatre Royal, Humber-street, Hull, which was destroyed by fire about five years ago.

Tynemouth. — The arbitration between Mr. Lawton, the contractor for the Tyne piers, and the Tyne Improvement Commissioners (which was adjourned in May last after a few days' sittings), was lately resumed at Tynemouth, before Sir John Rennie (the umpire), Mr. Bidder (arbitrator for Mr. Lawton), and Mr. Leslie, of Edinburgh, for the River Tyne Commissioners. Mr. Lawton's contract for constructing portions of the north and south piers amounted to 166,000*l.*; and the present arbitration is as to the amount due from the commissioners to the contractor for "extras," the latter claiming 105,000*l.*, whilst the former contended that the sum so claimed was 100,000*l.* more than was due to the contractor. Mr. R. P. Philipson, of Newcastle, conducted the case for Mr. Lawton; and Mr. Lloyd and Mr. H. Shield, instructed by Mr. John Clayton, town clerk of Newcastle, and Mr. T. C. Leitch, town clerk of Tynemouth, represented the commissioners. The sittings were adjourned, after certain procedure, in order to enable the parties to make efforts, between themselves, to settle matters in difference.

FROM SCOTLAND.

Edinburgh.—Dr. Cowan gives an account in the *Scotsman* of the frightful condition of the wynds and closes in the old town to which we long since drew attention. Dr. Cowan says of various places he had visited:—

"It might be well to restrain our indignation at American slavery so long as this disgraceful neglect is permitted within five minutes' walk of our own dwellings. The smell of the foul air in these rooms is indescribable; but in two especially, when the door was opened, I was driven back staggering, my brain reeled, and I was seized with nausea which continued for several days. Out of one of these rooms I learned that two cases of typhus fever had been removed to the infirmary the day before my visit. In every 'land' I saw cases of consumption, scrofula, and rheumatism, arising from bad air, damp, and want of proper food. To all this suffering is to be added dire poverty, neglect, and hopelessness."

Stonehaven.—The plans for a proposed combination poor-house which have been prepared by two architects selected for that purpose, viz., Messrs. Matthews and Henderson & Son, Aberdeen, have been exhibited.

Aberdeen.—A school has been recently erected in Holburn-street, in accordance with the will of the late Mr. James Ross, of Cuparstown, who left a large sum of money for the purpose, and also for its endowment. The trustees acquired a commodious site in the centre of a populous district, at a cost of about 450*l.*; and the cost of the building will amount to about 2,500*l.* The centre building is entirely devoted to a school-room, made to accommodate upwards of 300 scholars of both sexes, and is so constructed that it may, when required, be divided into two rooms. It is 62 ft. long by 28 ft. wide, and 36 ft. high to the apex of the roof. The main timbers of the roof form a Gothic arch, the space between each being plastered on the rafters. On either side of the school-room there are class-rooms for the boys and girls respectively, 28 ft. 6 in. by 17 ft. and 14 ft. high: communicating with these are master's and mistress's rooms, with closets, &c., adjoining. At the entrances, on each side, are cloak-rooms and passages of communication to the playing-grounds, at the back of the building. In the tower are rooms for the keeper of the school, a clock and bell chamber in the roof, and a furnace-room and coal-cellar in the basement. The school-room and class-rooms are heated with Perkins's patent hot-water pipes. The whole of the walls and other masonwork are of blue Aberdeenshire granite. The contractors were Messrs. Peter Bisset, mason; D. Macandrew, carpenter; Wm. Thomson, plumber; James Morrison, plasterer; and George Currie, slater. The ironwork for the building was supplied by Messrs. Walter Macfarlane & Co., Glasgow; the iron railing and gates by the Falkirk Company; and the hot-water apparatus by Mr. Robert Ritchie, Edinburgh. The architect was Mr. T. Russell Mackenzie, Aberdeen.

Inverness.—The foundation-stone of a new United Presbyterian Church has been laid in Queen-street. The site adjoins that of the building known as the Bishop's Mission School, and the church itself will be of a plain character, calculated to accommodate some 600 persons. The architects are Messrs. Ross & Joass, of Inverness; and the contractors are—mason work, Mr. Munro, builder; carpenter work, Mr. A. Robertson; and slater work, Mr. Russell.

CHURCH-BUILDING NEWS.

Calne (Wilts).—The old Norman church of Calne will be opened for divine service on the 22nd inst. The church has been restored, both externally and internally. The old high-backed pews have been replaced by seats, all free. Several stained glass windows have been presented, besides a carved pulpit and lectern. The church has been restored under the superintendence of Mr. Slater.

Clifton (Bristol).—The foundation-stone of All Saints' Church, Clifton, has been laid by Mr. Beresford Hope. The site of the proposed building is in a field close to Pembroke House, and abutting on the Pembroke-road, on ground formerly belonging to the Merchant Venturers of this city. The design is by Mr. G. E. Street, of London. The church will be situate in the midst of a populous and still-increasing neighbourhood; and every seat is to be free and unappropriated for ever. The whole cost of the building, when completed, will be 8,000*l.*, of which one-half has been obtained. There will be no seats in the aisles, these being used only as passages, this having been arranged so as to obviate the difficulty which persons in side aisles experience, when seated behind pillars, of seeing the minister. The style will be Gothic, and it will consist of a chancel, nave, and north and south aisles. The chancel will be 45 ft. in length, and 24 ft. wide inside the piers. On either side of these will be a chamber, 18 ft. wide: that on the north side will be used as an organ-chamber. The dimensions of the nave will be—length, 111 ft. 8 in.; width, 56 ft. 6 in. The church will accommodate upwards of 1,200. The aisles will be divided from the nave by five arches along each side, which will rest on octagon piers, having carved capitals. Over each arch will be a three-light traceried window, and at the east end a stained-glass window, under which will be a reredos. There will be two entrances—one, the principal one, on the west side, and another on the south-east side, under the tower, upon which will be a lofty spire. There will be no pews, but chairs will be used in the nave. The whole of the interior of the church will be painted, and, with freestone dressings, will be similar to the exterior.

Nottingham.—The new church of All Saints has been consecrated. The style is called "an approximation to the Early Decorated, of somewhat severer detail." It is a mixed Gothic, conventionally treated, and with some traces of Continental ideas. The tower runs up, equilaterally, to the height of 80 ft. or 90 ft., when it slants off to an octagon, which shape is kept on a gradually diminishing plane until the top of the spire is reached—175 ft. from the level of the ground. The spire is not yet completed; but it will have the customary spirelets and stormlights, surmounted by gables and crosses. Interiorly the nave is divided from each aisle by five equilateral arches, springing from red Mansfield stone columns, with white stone moulded capitals. The roofing throughout nave and aisles is of a plain open-timbered character, plastered between the rafters, and stencilled all over with a Gothic pattern, in which the sacred monogram frequently recurs. At the west end of the nave is a baptistery. The use, in the windows, of green and white glass, in small diapers, has to some extent made up for the absence of stained glass. The chancel is divided from the nave by a Gothic arch. The inner rim is of coloured alabaster, resting on Devonshire marble pillars, with carved capitals and corbels. An arch of similar, but less ornamental, character divides the south aisle from the organ-chamber and vestry, and the north aisle from the chapel. Behind the chancel, in the extreme east, is the apsis. The reredos is decorated all round with majolica of a gold and black diaper pattern, over which is a pyramidal ornament and moulding. In the centre compartment of the reredos are five medallions, containing the apocalyptic symbols of the four evangelists—the face of a man, a lion, a calf, and an eagle, answering to Matthew, Mark, Luke, and John, respectively, while the *Agnus Dei* is in the middle. The lower level of the chancel is paved with parti-coloured tiles, which, together with the majolica ware, came from Messrs. Minton's, at Stoke-upon-Trent. The principal dimensions of the edifice are as follows:—Nave, 78 ft. by 25½ ft.; extreme outer length of the building, 150 ft.; aisles, 13 ft. wide; chancel, 37½ ft. by 21½ ft. In the clerestory are eight three-light and four single-light windows. The material used throughout the body of the church is a Derbyshire stone, popularly known as Coxbench, with dressings of white Ancaster stone, and bands of red Mansfield stone. The roof is high-pitched, and covered with red and blue Staffordshire tiles. The churchyard, which is of limited area, is enclosed by Bulwell stone walls. A space of ground on the south or Radford side is set aside as the site of the parsonage-house, and the Girls' and Infants' School buildings will probably be in the immediate neighbourhood. The architects are Messrs. Hine & Evans, of Nottingham; the builders, Messrs. A. & R. Dennett, also of Nottingham; sub-contractors, Mr. Thompson, of Ollerton, for carved work; Mr. W. N. Nicholson, of Newark, for the ventilating and heating apparatus; Messrs. Thomasin & Co., of Birmingham, for the gas-fittings; Mr. J. M. Marshall, of Nottingham, for coloured decorations; and Mr. B. Wheeler, of Nottingham, for the glazing and plumber's work. Messrs. Taylor & Co., of Loughborough, have contracted to supply a peal of eight bells; while Messrs. Lloyd & Dudgeon, of Nottingham, are constructing the organ.

Dudley.—The movement for the restoration of St. Edmund's Church is proceeding. Earl Dudley has promised to give 500*l.* towards the cost, but he strongly advises that the work shall be as completely done as possible. Mr. John Fisher has intimated that it is his intention to present a stained glass window for the chancel, which shall not cost less than 200*l.* It is proposed to thoroughly restore and alter the interior of the church. The whole of the windows are to be renewed according to an improved design, and the large pillars which divide the nave from the transepts are to be cut down. The total cost of the restoration is estimated at about 1,400*l.* or 1,500*l.*

Darlington.—At a recent meeting of the commissioners for the restoration of St. Cuthbert's church, a report was read from which it appeared that the total amount of subscriptions and guarantees to the fund for the restoration to the present time is 5,816*l.* Contracts for laying the warming apparatus, gas pipes, concreting and flooring the church and transepts, and providing temporary sittings, have been let to Mr. D. Hurworth and Mr. Elwin, at the sum of 226*l.* 4s. 6d., and 221*l.* 12s. The restoration of the chancel by the Duke of Cleveland, will delay the opening of the church beyond the time anticipated. With the exception of the chancel, the edifice was placed in the hands of Mr. Scott to restore. The work is pretty well advanced now, some 7,000*l.* having been expended, and the effect of the whole can be judged. Of course all "lofts" and "pews," ceilings and whitewash, have been removed; the aisle walls partly rebuilt, the roofs, the chief part of which remained, raised to their original height, and the perished stonework carefully restored. The chief work, however, has been rebuilding the two west piers of the centre tower, which were cracking under the weight owing to a disturbance of the sandy substratum caused by the deep drainage of the town. These piers, after propping up the tower at an enormous expenditure of timber, were re-

constructed piece by piece, with hard selected stone. The shoring is now all removed, and the effect of the interior fully seen. The Duke of Cleveland, in addition to 1,700*l.* subscribed by himself and brothers, has placed the chancel in the hands of Mr. S. P. Pritchett, of Darlington, with instructions to carry out its restoration in no way inferior to the rest of the church.

Felling.—The foundation stone of Christ Church, Felling, according to the *Newcastle Courant*, has been laid. The parish church is situate at Heworth, but is at too great a distance for the inhabitants of the Felling to attend. The site is a little to the north of the Felling railway station, and is built from designs by Messrs. Austin & Johnstone, of Newcastle, architects. The style is Early Pointed, and the edifice will consist of chancel, nave, aisles, organ chamber, and vestry. Accommodation will be provided for about 150 persons, and arrangements have been made so that the building may be enlarged, if it should be found necessary. The walls are approaching completion, and the stone was laid in the interior, forming part of one pillar.

DISSENTING CHURCH-BUILDING NEWS.

Nayland (Suffolk).—The new Congregational Chapel and Schools here have been opened. The site of the building allows of the schools being placed under the chapel, very slightly below the ground, as the road at the entrance is considerably elevated. The principal front consists of a central gable, containing a triple window, and surmounted with a coping and finial. On either side is a projecting porch with double doorway, leading to the chapel on the ground-floor, and containing staircases up to the gallery and down to the schools, and forming wings to the centre. The number of sittings obtained is about 300, including 60 children in the gallery at the end over the entrances. The principal timbers of the roof are stained and varnished, the ceiling being level with the collar-beam, 27 ft. above the floor, ventilation being secured within the roof. The sittings are in open benches of white deal and varnished, the gallery front and platform finished to correspond. The schools will accommodate 150 children (allowing 6 square feet to each), besides two class-rooms, with lavatories and other conveniences. The exterior is faced with red bricks, relieved by black bands, the windows and porches and other dressings being of Bath stone. An ornamental wall incloses the front. The contract for the chapel and schools has been executed by Mr. Salmon, of Halstead, builder, for the sum of 900*l.*, from the designs of Mr. F. Barnes, architect, Ipswich.

Worcester.—A new Independent Chapel has been opened at Polesden. The total cost of the building is estimated at 700*l.* The style is Gothic;—internal dimensions, 40 ft. by 20 ft., with vestry 12 ft. by 11 ft., and chapel-keeper's house, with accommodation for meetings. The walls are built with red bricks, and Bath stone weatherings; white bricks to all external quoins, window-jambs, and mullions. The arches to doors and windows are alternated with blue and white bricks, and Bath stone keys. The walls are also relieved with blue brick strings. Light is obtained by four lancet windows on each side, and a three-light window at the west end over the entrance-doors. The roof is open to the apex, with principals springing from stone corbels, and plastered between the rafters. The whole of the timbers throughout are stained and varnished. The roofs are slated with green and purple Bangor slates, in lozenge pattern, and ornamental ridge crests. The benches are all marble, with ornamental cast-iron ends. The architect was Mr. G. Johnson, of this city; Messrs. Holland & Wainwright builders.

Clifton.—The Unitarian Chapel, newly-erected in Clifton, has been dedicated. The building consists of nave, aisle, chancel, organ-chamber, and singers' gallery, and minister's and deacons' vestries. The nave is 72 ft. by 28 ft., and 50 ft. to under side of roof; aisle, 72 ft. by 13 ft.; chancel, 19 ft. by 21 ft. The arrangement of the building is similar to that of an ordinary Church of England. The style is that of the fourteenth century, and the materials used are native stone from the Pembroke-road quarries, with freestone dressings. The nave is separated from the aisle by an arcade of five arches, supported on polished granite shafts from Aberdeen. The chapel is at present fitted up to accommodate 400 persons. Under the windows is a string-course of tiles with a flowing pattern, running round the edifice. The last window is filled with stained glass, representing the "Last Supper," by Mr. O'Connor, of London. The chancel arch is formed with shafts of polished Devonshire marble. The finish of the tower is only temporary, it being the desire of the committee to raise it some 30 ft. higher when their funds will allow. The building was erected by Mr. W. Haines, jun., and the architects were Messrs. Popes & Bindon. The cost has been about 6,000*l.*, including the land.

Cranswick (near Driffield).—The Primitive Methodist new chapel, Cranswick, has been opened. The chapel contains 360 sittings, 110 free. It has been built after designs by Mr. H. Fippard, of York, architect. The cost, including the town clock, but not including old materials, amounts to 500*l.*, 350*l.* of which sum have been contributed.

RAILWAY MATTERS.

Amongst the new railway schemes which will come before Parliament in the next session is one for the construction of a railway under the river Mersey, for the connexion of Liverpool and Birkenhead. The Bill will be supported by the Great Western and London and North-Western Railway Companies.

A new first-class railway carriage has been constructed in France. It contains as many places and is as commodious as those at present in use. A passage, which traverses the carriage in its full length and leads to a water-closet, permits the guards to keep a strict watch over all that passes during the progress of the train. The travellers, moreover, can walk and smoke on a covered platform placed at each end. The construction does not cost more than ordinary. The Strasbourg Railway Company have used this new carriage on their line for several months, and travellers avail themselves of it in preference to all others.

An American, writing to the *Times* on railway subjects, says:—"Each car has a receptacle for cool water for drinking, also a towel and water for the hands, and other conveniences very desirable on long as well as short journeys. A stove of sufficient size is also placed in each car, and thus all parts are in the winter warm and comfortable. Seats are so contrived that they are like sofas, having space for two, the backs of each being made to accommodate the figure, and those using them can always ride facing the engine. One car on most trains is specially placed there for ladies unaccompanied by gentlemen. There are also cars used for night travelling, so constructed that the occupants can lie at full length and enjoy sleep with comfort, which are likewise used during the day, each car having two doors and a passage through the entire centre, which is constantly perambulated by the guard or conductor, there being accommodation for forty or fifty persons." He states that he has sent his luggage from Milwaukee to New York, a distance of 1,000 miles, and found it in his room at a hotel when he arrived.

The traffic receipts of railways in the United Kingdom, amounted, for the week ending the 12th November, on 11,706 miles, to 618,020*l.*, and for the corresponding week of last year, on 11,358 miles, to 569,639*l.*, showing an increase of 348 miles, and of 48,381*l.* in the receipts.

OPERA.

Her Majesty's Theatre.—It was somewhat provoking for Mr. W. Harrison that his first utterance in his new theatre should be in the character of an apologist. However, so it turned out; for on Tuesday evening Mr. Sims Reeves appeared only in the shape of a note from Mrs. Reeves, saying he was too unwell to sing. The pit and the gallery shouted almost in the same words, with more force than elegance, "Shame! He's always doing it!" but, with an evident wish not to let the manager think they attributed any blame to him, took it very easily, and had every reason to be satisfied with an excellent performance of *Faust*, Mr. Swift supplying the deserter's place in an admirable manner. Miss Louisa Pyne, who never disappoints her public in any way, sang most charmingly. On this, Friday evening, "Don Giovanni" is to be given in English, with the whole lady-strength of the company.

Covent Garden.—Mr. Chas. Adams has greatly improved his position by his performance of *Elvino*, in the "*Somnambula*." In much of the music he left little to be desired, notwithstanding a tendency to get occasionally out of tune. The new lady singer, whom the opera introduced to the English stage, Madlle. Martorelle, not unknown in concert-rooms, possesses an agreeable voice, and displayed much grace and elegance. Careful study will give her a good future. The performance of the opera was altogether satisfactory, Mr. Weiss and Miss Illingworth aiding in producing that result. A new opera, by Mr. Hatton, titled "Rose," is advertised for Saturday.

Touching Covent Garden Theatre, a "near resident" expresses the regret which many must feel, that buildings are being erected in Hart-street, nearly close up to the theatre, and so increasing the chance of its destruction by fire.

Drury Lane.—A dozen lines as to the scenery of "Macbeth," in a chronological point of view. The period of the play is *pre*-Norman, as was illustrated at the Princess's Theatre, when "Macbeth" was revived by Mr. Charles Kean. None of the scenery at Drury Lane gives the slightest indication of this fact. So far from it, that in the last scene of the first act, and elsewhere in the play, pointed arches filled in with fourteenth century tracery are depicted, and the ceilings of some of the rooms are of the same or even later date, showing emblazoned shields in the cornice.

Miscellanea.

The Dublin International Exhibition.—H.M. the Queen has graciously consented that the proposed Exhibition shall be announced as under her Majesty's patronage. Prospects are very encouraging.

An Iron Hill discovered.—On the Canadian shore of Lake Superior, a hill 600 ft. in height, and several miles in length, composed mainly of iron ore, yielding 60 per cent. of iron, has been discovered by an Indian. It is said to form part of the Marquette range of iron ore.

A Metropolitan Hydraulic Power Company. A scheme for the supply of London with water at high pressure, for mechanical and other purposes, and for use in fires, is to be submitted to Parliament in the ensuing session, when application is to be made for an Act to incorporate a company with power to open the streets, &c., and erect machinery and apparatus for the supply of hydraulic power.

New Schools at Poplar.—A contract has been entered into for the erection of a new school-building in the rapidly-increasing neighbourhood of North-street. The schools, when completed, will be furnished with all modern improvements, and will afford accommodation for upwards of 200 boys, girls, and infants, together with the necessary apartments for master, &c. The foundation stone of these schools has been laid by the rector.

The Thames Embankment Contractions.—We have received printed copies of a correspondence which has passed between Mr. Ridley and Mr. Thwaites, the chairman of the Metropolitan Board of Works. Mr. Ridley, it will be remembered, sent in the lowest tender for the first part of the Thames Embankment works. That tender was, however, set aside for reasons not given. In examination on the subject before Lord Robert Montagu's committee, Mr. Thwaites hinted that the Board had heard something to Mr. Ridley's disparagement, which he would rather not name. Mr. Ridley naturally considers an insinuation of this kind calculated to do him much harm, and calls upon Mr. Thwaites to make known what he meant. Mr. Thwaites refuses: and Mr. Ridley throws himself upon the public.

The Southampton School of Art.—The annual examination of this school in drawing has been held at the school, in Victoria Rooms. In addition to the students of the School of Art, there were candidates from sixteen public and private schools; and although one large school, where there are 580 children learning to draw, was not represented this year, the large number of 387 papers were worked in the presence of the examiner, Mr. S. S. Hart, R.A., who expressed much satisfaction at the amount of work done, and the general excellence of the drawings made in his presence from a group of objects arranged by him. Mr. Hart expressed his surprise that the School of Art is located in a building so little adapted for it, and pointed out to a member of the committee the "utter impossibility" of the students successfully engaging in the higher branches of art, under such conditions of light and in such a confined space.

INDUSTRIAL MUSEUM AND SCHOOL OF ART FOR NORTH-EAST OF LONDON.—In connexion with the recent exhibition at Islington (the surplus money profit of which will be about 1,000*l.*), a meeting of the local committees of working men has been held, at which it was resolved to endeavour to establish a museum and school of art for the district. Mr. H. Sales attended on behalf of the Society of Arts, and promised aid conditionally; and it was resolved to send a deputation to the Chancellor of the Exchequer on the subject.

ROYAL SOCIETY.—The medals have this year been awarded as follows:—Copley medal: Mr. Darwin, F.R.S., for his researches in geology, zoology, and botanical physiology. Royal medals: Mr. J. Lockhart Clarke, F.R.S., for his researches on the intimate structure of the spinal cord and brain; Mr. Warren De la Rue, F.R.S., for his observations on the total eclipse of the sun in 1860, and for his improvements in astronomical photography. Rumford medal: Dr. J. Tyndall, F.R.S., for his researches on the absorption and radiation of heat by gases and vapours.

IPSWICH TOWN-HALL.—The committee report that they have again considered the plans submitted to them, and have selected two (one by Messrs. Bellamy & Hardy, of Lincoln, and the other by Mr. Phipson), as most capable of improvement. Having conferred with the architects, these plans had been modified, and the committee finally decided on Mr. Bellamy's plan as the best. The report was received, but a resolution for a committee to consider and report whether the required accommodation could not be provided at a much smaller outlay than had hitherto been proposed, was carried by a majority of 15 to 14, and a committee appointed.

THE THAMES MARSHES.—In the course of a paper on the Erith explosion and repair of the breach, read by Mr. Lewis Moore, at the Society of Engineers, on the 7th instant, Mr. Moore said,—It is a very remarkable circumstance that the marshes on the river side of the walls still unreclaimed and termed "salt marshes," are invariably at a level of high water, whereas the land reclaimed is generally 5 ft. or 6 ft. below that level. Whether the constant action of the tide raises the land subjected to it, or whether the absence of that influence allows the level of the marshes to subside, or whether it is due to both these circumstances, is a fit subject for discussion; but, be it as it may, there is no question of the fact that they do so exist.

DUBLIN.—A new Presbyterian church, situate at the top of Rutland-square, and erected at the sole expense of a citizen—Mr. Alexander Findlater—and presented by him to the congregation of St. Mary's Abbey, has been opened for divine service. The centre of the church is lighted by six Mediæval coronas, of thirty lights each, suspended from the roof. These were made for the church, from the design of the architect, Mr. Heaton, of Perth, by Messrs. Edmundson & Co., of Capel-street. The galleries and staircase are lighted by brackets, and the lobbies and vestibules by circular lanterns, with Mediæval brass mounting.

LIVERPOOL ARCHITECTURAL SOCIETY.—At the fourth meeting of the present session, Mr. Joseph Boult in the chair, the principal subject of discussion was the intention of the Great Western Railway Company to apply to Parliament in the next session for power to construct a tunnel under the river Mersey. The company proposed to leave the Chester and Birkenhead Railway at Bebington Station, and, by means of a tunnel under the Mersey, to connect that point of the Cheshire shore with Sefton-street, Liverpool; and from thence the line would be continued to the proposed central station in Ranelagh-street, for which an Act was obtained during the last session of Parliament, the site being the Waterloo Hotel. Mr. Boult remarked that the idea of tunnelling under the Mersey was not a new one, it having been suggested when the Birkenhead and Chester line was projected some thirty years ago, the object being to avoid the annoyance of crossing the river. George Stephenson, who was consulted upon the project, advised against it, chiefly on the ground that the new red sandstone was in a very shattered condition, full of fissures and flaws, and that on this account the work would be dangerous. The general opinion appeared to be in favour of the scheme. Mr. G. A. Audsley exhibited a number of effects of colour produced by a new optical instrument, invented by himself, and called the Trocheidoscope.

THE SANITARY STATE OF BLACKBURN.—It is stated that fever of a malignant type has broken out in the Blackburn Union, where there are now seven thousand operatives out of work, and the guardians of the district are about to appoint an inspector of nuisances to rid the town of many existing nuisances.

THROWING MUD INTO THE THAMES.—The Southwark and Vauxhall Waterworks Company have been fined, at the Wandsworth Police Court, in the sum of 20*l.*, for throwing or slushing what is estimated as 100 tons of mud into the river at Battersea; a practice whereby the company are said to save 600*l.* a year in the cleansing out of their reservoirs!

LEIGH WOODS.—The *Bristol Mirror* says that the preservation of this delightful locality is again attracting public attention. There are two schemes—one propounded by Mr. H. A. Palmer, who proposes purchasing the woods, by funds raised by subscription and a rate distributed over many years, devoting the property to the purposes of a place of recreation for the citizens. A joint-stock company propose to erect villas in certain parts of the woods, preserving the remainder for public purposes, and free from buildings. Mr. Palmer repeats his offer of 1,000*l.* towards a fund for preserving the property. It is to be hoped he will be supported in his desire.

ACCIDENTS.—During recent heavy rains, a large portion of the flint walls of two new houses, building in the Church-field, Seaford, fell down. The walls had been run up very quick, and the season being late, the mortar had not time to dry before the rains came ——One end of an old building at St. Helen's, used as a glass-smoothing shop by Messrs. Pilkington, has given way, carrying with it four young women who were employed on the premises. One of them, who had her thigh broken, and was otherwise seriously injured, was buried some two or three yards beneath the bricks and mortar, but was saved by a broad flag, which prevented the bricks falling on her head, and that of a companion, who also escaped with life. The others escaped with a few cuts and bruises.

MORE ROMAN REMAINS IN THE ISLE OF WIGHT. A correspondent of the *Hampshire Independent* gives an account of the discovery of some Roman remains at Gurnard Bay. Copper, lead, and iron were being continually thrown on the shore, including a copper coin of Antoninus, a silver coin of Sept. Severus, and a bronze one of Augustus Cæsar. A large stone, which had recently fallen from the cliff, had a mass of mortar adhering to it. He ascended the cliff, and on examining the outer face, within about a foot of the top, discovered a long white line, which disclosed a tesselated pavement with a worked stone at the end of it. Mr. J. B. Bird, the agent to the owner of the estate, provided labour, and the result hitherto has been the uncovering a foundation of stone on the north side, of the length (excluding a portion dropped from the cliff of about 7 ft.) of 33 ft. There have been two rooms, about 15 ft. in length by about 9 ft. 9 in. in breadth; whilst attached to them was apparently a small cooking-place, with a raised fireplace in the centre, reached by steps from the inner of the two apartments. Round this apartment on all sides fragments of pottery, one coin, and what appeared to have been an ancient billhook for chopping wood, were found.

ARCHITECTURAL ASSOCIATION: VOLUNTARY EXAMINATION CLASS.—The class will meet on Tuesday next, when Mr. Rickman will continue the subject of Gibbon's "Law of Contract."

TENDERS.

For new offices and warehouses, Crutched Friars and Savage-gardens. Messrs. John Young & Sons, architects:—

Downes	13,930	0	0
Brass	13,200	0	0
Conder	12,988	0	0
Mansfield & Sons	12,980	0	0
Lawrence & Sons	12,892	0	0
Ashby & Horner	12,590	0	0
King & Sons	12,550	0	0
Browne & Robinson	12,285	0	0
Myers & Sons	12,176	0	0

For warehouse, Sussex-place, E.C.

King & Son	£649	0	0

For building a school-room to be attached to a chapel in the Battersea-road. Mr. Charles W. Lee, architect:—

Parsons	£525	0	0
Pitts	509	0	0
Spicer	460	0	0
Pain (accepted)	417	0	0

For new building No. 53, Great Tower-street. Messrs. John Young & Son, architects:—

Myers & Son	£1,519	0	0

CLARK'S SELF-COILING SHUTTERS are used to CLOSE the ENTRANCE of THEATRES.

CLARK'S SELF-COILING SHUTTERS are used to CLOSE the PROSCENIUM of THEATRES.

Note.—These are the only description of Self-coiling Shutters extant, of which Messrs. CLARK & COMPANY are the Sole Patentees and Manufacturers.

LONDON:
Chief Office: Gate-street, Lincoln's-inn-fields.
New Works: Rathbone-place, Oxford-street.
PARIS: Rue Notre-Dame des Victoires, 42.
MANCHESTER: 4, Market-street.
GLASGOW: 67, Buchanan-street.

THE CROOKED CHIMNEY.—A small treatise, illustrating with diagrams an apparatus adapted for sweeping the crooked as well as the straight chimney flue, remedying where the ordinary machine from one standing point will not go. Price 1s. 6d.—Orders received by R. BARLOW, 38a, Lamb's Conduit-street, Foundling, London. Subscribers, at an extra cost of 2s. may (when it is practicable) have the work delivered, when a model crooked chimney flue and apparatus will be shown. Illustrative of the treatise. No cash received until the work is sent or delivered.

MR. JAMES FENTON, ENGINEER and SURVEYOR for six years to the Croydon Local Board OFFICES REMOVED to 19, GREAT GEORGE-STREET, WESTMINSTER.

MR. MARDON, ARCHITECTURAL DRAUGHTSMAN and COLOURIST. Perspectives, Competition, and other DRAWINGS prepared.—Address, Bedford Chambers, Southampton street, Strand, W.C.

ENGINEERING, SURVEYING, ARCHITECTURE, &c.—PRACTICAL INSTRUCTION given in Civil Engineering, Surveying, Levelling, Plan Drawing, Measuring, Estimating, &c. in a short Course of Office and Field Work, on moderate terms, including the use of the instruments, &c. For Prospectuses, apply at the Offices of Messrs. HYDE, SMITH, & LEWIS, Civil Engineers, Surveyors, Architects, &c. 24, Guildford-street, Russell-square. N.B. DAY and EVENING Instruction given in Architectural Drawing, Colouring, Taking out Quantities, &c. &c.

SEWAGE of TOWNS.—JOHN MARRIAGE, the Lessee of the Lands upon which the Croydon Sewage is applied, ADVISES and ASSISTS Boards of Health, Corporations, Owners of Estates, and Agriculturists, &c. &c. as to the APPLICATION of SEWAGE to LAND, the mode of its distribution, the suitability and manner of laying out such Land, and all the details connected with the profitable Utilisation of Sewage. Grassmere, near Mitcham, Surrey.

TO CIVIL ENGINEERS AND SURVEYORS.

PARLIAMENTARY WORK.—An ENGINEER and SURVEYOR, of long experience, is open to an ENGAGEMENT.—Address, E. M. No. 2, Grosvenor-villas, Stockwell-green, S.

PERSPECTIVE DRAWINGS MADE and COLOURED by an experienced Architectural Draughtsman and Colourist.—Address, Mr. JOHN WHITCROFT, 20, Old Cavendish street.

COLUMNS, GIRDERS, &c. in CAST or WROUGHT IRON.—General and Detail DRAWINGS, with Estimates, are prepared for Architects and others requiring such assistance, by an Engineer who has had great experience in designing and carrying out works in iron and other materials. Terms moderate. Apply to C. E. care of Mr. Goodman, Stationer, 377, Strand, W.C.

PARTNERSHIP.—A Gentleman, practically acquainted with Painting and Decorating, and who could superintend that department, is wanted to TAKE the PLACE of a RETIRING PARTNER, in an old-established Business, in a large provincial town. Capital required, about 2,800l. Apply to Mr. S. COPPING, Solicitor, 7a, Basinghall-street, London.

ARCHITECTURAL PARTNERSHIP.—A Gentleman, who has had upwards of 12 years' experience in architecture and civil and military engineering, and who is thoroughly competent to take the entire Management of an Office, desires to enter into PARTNERSHIP with a well-established Architect and Surveyor, to whom he is willing to pay a premium.—Address, G. W. A. Office of "The Builder."

A COMPETENT ASSISTANT WANTED by an Architect and Surveyor in London. Must be a first-rate draughtsman, well acquainted with the practical parts of building, and used to London work.—Address, by letter only, stating age, qualification, salary, &c. to ALPHA, Charles Barker & Sons, No. 8, Burlington-place, London

CONSTANT EMPLOYMENT.—WANTED, a Man as PLUMBER and GAS-FITTER, and willing to take himself generally useful. Wages, 27s. per week.—For address, apply to Mr. FOSTER, No. 8, Gretton-terrace, Green street, Bethnal green.

ESTATE CARPENTER WANTED.—Must be a skilful workman: capable of house-fitting; able to measure timber, sawing, &c.; write a good hand, and keep small accounts. A Churchman, a married man without incumbrance, preferred. Wages, 1l per week, with house and garden.—Address, in own writing, giving references, age, &c. to Mr. LEWIS TAYLOR, Estate Office, Mells, Frome, Somerset.

TO ARCHITECTS' ASSISTANTS

SAMPLES of BRICKS, TILES, &c.
Made at EAST COWES PARK.
Can be seen in the Constructional Department,
KENSINGTON MUSEUM.
R. LANGLEY, Agent.

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr. ROBERT WHITE, and which may be seen in operation at the Brickfields of
J. B. WHITE & BROTHERS, Erith, Kent.
The advantages of this plan are two-fold.
1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving.
2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.
Licenses for use of the Patent granted to Brickmakers, on application to the Patentees 17, Millbank-street, Westminster.

TO PLUMBERS, PAINTERS, and DECORATORS.—TO BE DISPOSED OF immediately in consequence of the death of the Proprietor, an excellent old established BUSINESS in the above line, which has been successfully carried on at Buntingford, Herts, by the late J. G. Cook, for the last 25 years. An energetic man would find this an opportunity seldom to be met with.—For particulars, apply to Mr. WRIGHT, Grocer, Buntingford, Herts.

TO BUILDERS.—Shortly TO BE DISPOSED OF, a BUILDER'S BUSINESS, in a large market town, about forty miles from London. The premises are complete, and a most lucrative trade has been carried on for many years, which may be further increased. The stock and fixtures to be taken at a valuation. Further information may be obtained, by applying to Messrs. HOWLDEN & HEATH, Surveyors, 4, Bloomsbury-street-building, E.C.

IRONMONGERY.—A London Firm, wholesale, are desirous of DISPOSING of their BUSINESS, a profitable one, and of old standing. It may be taken in whole or part, and will require some little capital.—Address, B.W. Office of "The Ironmonger," 24, Bow-lane, London, E.C.

MANUFACTORY at WALTON STREET.

LITTLE CASTERTON FREESTONE.
Apply, for prices, &c. to
OCTAVIUS N. SIMPSON, STAMFORD,
The Owner; and see Specimen at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect oolite) is raised in blocks of any portable size, and is about 4 feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed wise. It works freely with a tooth saw, and is wrought at a cheaper rate than any stone in the kingdom.
*** The above WEATHER STONE is used largely by London Builders.

The ONLY MEDAL "for STONEWARE"
has been awarded to
DOULTON & WATTS,
LAMBETH POTTERY,
LONDON.

In expectation of a greatly increased sale, D. & W. have determined to introduce the ancient pattern of their ENAMELLED STONEWARE CLOSET PANS, at the price of the commonest description of earthenware.

Experience has shown that this shape is the most simple in detail and that in strength, durability, and cleanliness it cannot be surpassed by the most expensive closets.

FIGURE "D" STONEWARE CLOSET PAN AND TRAP, 3s. 9d. COMPLETE.

VENTILATION—PURE AIR.

Sheringham's Day and Night Ventilator

for the admission of Pure Air

THROUGH THE EXTERNAL WALL.

These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the blinds are closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street, Borough, London.

DENT'S TURRET CLOCKS.

—The attention of Public Bodies, Gentlemen, and others, is respectfully requested to the Improvements made in the Construction of CLOCK, suitable for STABLES, CHURCHES, and other Large Buildings, by the late E. J. DENT and F. DENT, Clock and Chronometer Makers to the Queen and Prince Consort, and Makers of the GREAT CLOCK for the HOUSES of PARLIAMENT, &c. Turret Clocks, with Compensation Pendulum, adjusted for variations of temperature, to work the hands of dials of any size, from 1 foot to 21 feet diameter.

E. DENT & CO. 61, STRAND (adjoining Coutts's Bank); and 34 and 35, ROYAL EXCHANGE, LONDON.

SALES BY AUCTION.
